I. Introduction and Summary of Conclusions

A. Assignment and Qualifications

1. We have been asked by counsel to the Republic of Peru (Peru or Respondent) to review and comment on the report of Howard N. Rosen and Chris Milburn dated May 29, 2015 (the FTI Report),[1] which quantifies damages to Bear Creek Mining Corporation (Claimant) from the alleged expropriation by Respondent of its Santa Ana mining project (Santa Ana or the Project).

2. Our professional qualifications are as follows:

3. **Graham A. Davis** is the William J. Coulter Professor of Mineral Economics at the Colorado School of Mines (CSM), where he has been a full-time faculty member since 1993. One of his main teaching and research fields is mine valuation under uncertainty. His peer-reviewed research papers on asset valuation have been cited over 300 times. At CSM, he teaches a 15-week graduate course on advanced mineral and energy asset valuation, which includes instruction on the use of discounted cash flow, real options, and simulation methods to value and manage natural resource projects. Professor Davis has also published extensively on these topics and he teaches a three-day short course, with Dr. Michael Samis, on advanced mineral and energy project valuation. The course is offered through the Continuing Education Division of CSM. Around 200 mining and energy industry practitioners have attended offerings of this course in Canada, the United States, and Australia.

4. Professor Davis' academic research is complemented by consulting to major mining companies, including Newmont Mining and Rio Tinto. He has served as an expert witness in disputes involving mine valuations for both claimants and sovereigns. He has also worked as a Metallurgical Engineer in major mining companies in Africa and Canada. In all, he has worked at six different open pit and underground mines spanning the production of uranium, copper, silver, gold, molybdenum, lead, and zinc.

5. He is a Qualified Person for valuation under the Canadian National Instrument 43-101 (a standard designed to ensure accurate resource reporting for mining companies listed on Canadian stock exchanges), and he holds professional membership status in both the

[1] Expert Report of Howard N. Rosen and Chris Milburn, FTI Consulting, May 29, 2015, ("FTI Report").

Society for Mining, Metallurgy, and Exploration and the Australasian Institute of Mining and Metallurgy. He is also a Competent Person for valuation under the JORC reporting code in Australia. In 2014 the Society for Mining, Metallurgy, and Exploration and the American Institute of Mining, Metallurgical, and Petroleum Engineers awarded Professor Davis their Mineral Economics award "for research and teaching of modern methods of valuing and evaluating undeveloped mineral resources, and the role of minerals in economic development."

6. Professor Davis received a Ph.D. in Mineral Economics from Pennsylvania State University, an MBA from the University of Cape Town, and a BS in Metallurgical Engineering from Queen's University at Kingston. Professor Davis' resume is included in Appendix C.

7. **Florin A. Dorobantu** is a Senior Associate at The Brattle Group, a consulting firm with offices in New York, Washington, DC, Cambridge, MA, San Francisco, London, Madrid, Rome, and Toronto. He holds a Ph.D. and a master's degree in Economics from Duke University and a bachelor's degree in Economics and Business Administration from the American University in Bulgaria.

8. Since joining The Brattle Group in 2007, Dr. Dorobantu has performed valuation analyses in a variety of industries, including mining, oil & gas, large project engineering and construction, consumer goods, financial services, and business process outsourcing. He has prepared expert testimony on damages before the Permanent Court of Arbitration and the International Chamber of Commerce (ICC) and has performed consulting work in arbitration proceedings before the International Centre for the Settlement of Investment Disputes (ICSID), the London Court of International Arbitration (LCIA), and ICC, as well as matters in U.S. federal, state, and tax courts and regulatory proceedings before U.S. public utilities commissions. Dr. Dorobantu's resume is included in Appendix C.

9. We confirm that we are independent from the parties involved in this arbitration. For our work in this matter, The Brattle Group is being paid on a time and materials basis. Our compensation is not contingent on our conclusions or on the outcome of the arbitration.

B. Background and Summary of Conclusions

10. We understand that the Claimant seeks damages from the alleged expropriation of the Santa Ana project, a development-stage silver mining project located in the Puno province

of Peru. Claimant, through a Canadian subsidiary and its Peruvian branch, owned the concessions that formed the project.[2]

11. The Claimant was and is a publicly traded company listed in Canada on the TSX Venture Exchange.[3] In addition to Santa Ana, Claimant owned another project in Peru, Corani, which it held through a separate set of subsidiaries.[4]

12. We understand that on June 25, 2011, Claimant's rights to own and pursue development of the Santa Ana project were revoked through Supreme Decree No. 032-2011-EM (Supreme Decree 032). Because Santa Ana was located within 50 km of Peru's border with Bolivia, it could be owned and operated by a non-Peruvian entity only pursuant to special authorization. We understand that Bear Creek's rights to own and pursue development of Santa Ana had been granted in 2007 pursuant to Supreme Decree 083-2007-EM, which was revoked by Supreme Decree 032.

13. Claimant alleges that the issuance of Supreme Decree 032 constituted a breach of the Free Trade Agreement between Canada and Peru (FTA) and seeks damages equal to the Project's fair market value (FMV) as of June 23, 2011 (FTI Valuation Date).[5] The FTI Report estimated that the FMV of Santa Ana at the FTI Valuation Date was $224.2 million.[6]

14. Claimant seeks also damages to the Corani project that it contends resulted from the alleged expropriation of Santa Ana.[7] The FTI Report estimated that the damages to the Corani project were $170.6 million before pre-award interest.[8] Claimant seeks also pre-award interest between the FTI valuation Date and the date of the award based on a 5% annual interest rate, calculated with monthly compounding.[9]

---

15. We have been instructed to review the FTI Report and evaluate the reliability of its calculations of damages to Santa Ana and Corani, as well as its calculation of pre-award interest.

16. We understand that Respondent's position is that Claimant is not entitled to damages because Respondent has not breached the FTA. If damages are awarded by the Tribunal, we understand that Respondent argues they should equal at most the amount that Claimant had invested in the Santa Ana project by the date of Supreme Decree 032. We have been instructed to calculate this amount.

1. Santa Ana Damages

17. Our analysis of FTI's calculation of the FMV of the Santa Ana project starts from the fundamental premise that a reliable estimation of an asset's FMV must be consistent with market indicators of value for that same asset. In this case, FTI obtained a DCF estimate of Santa Ana's FMV that is well above the range of values derived from the market price of Bear Creek's publicly traded shares, even though FTI used that same market price to determine damages for Corani. The explanations that FTI offered for this contradiction do not withstand economic scrutiny and we conclude that FTI's assessment of damages for Santa Ana is unreliable and overstates the Project's FMV.

18. Bear Creek is a publicly traded company listed on the TSX Venture Exchange, a major Canadian stock exchange. In the period before the alleged expropriation of Santa Ana its shares traded freely and frequently on par with the largest mining companies in the world. Mining companies listed in Canada are subject to extensive disclosure standards and requirements, which make reliable information about each company's projects available to investors. Therefore, trades in Bear Creek's shares meet the requirements typically associated with the definition of FMV: open and unrestricted markets, arm's length trading between willing buyers and sellers, reasonable availability of information.

19. The market prices established by trades in Bear Creek's shares provide a direct measure of the FMV of its projects. This measure, called the enterprise value (EV), is directly observable and approximately equal to the combined FMV of Bear Creek's two main projects, Corani and Santa Ana.[10] FTI relied on Bear Creek's EV when determining the loss

[10] The approximation arises because Bear Creek's EV includes the value of other assets and reflects the possibility that the company would in the future identify positive net present value (NPV) projects.

Continued on next page

of value to Bear Creek associated with its Corani project. But Bear Creek's EV also provides a basis to calculate a market benchmark against which to compare FTI's DCF estimate of Santa Ana's FMV.

20. This benchmark is the portion of Bear Creek's EV attributed to Santa Ana. It was in fact calculated by FTI as a step in its estimation of damages to Corani. Applying this method and FTI's results, we derive a benchmark range of values for Santa Ana's FMV of $42 million to $149 million as of June 23, 2011 (FTI's Valuation Date). FTI's conclusion of damages for Santa Ana, $224.2 million, is 50% higher than the top end of the benchmark range, and 152% higher than the average benchmark. The discrepancy between FTI's damages and the benchmark is striking.

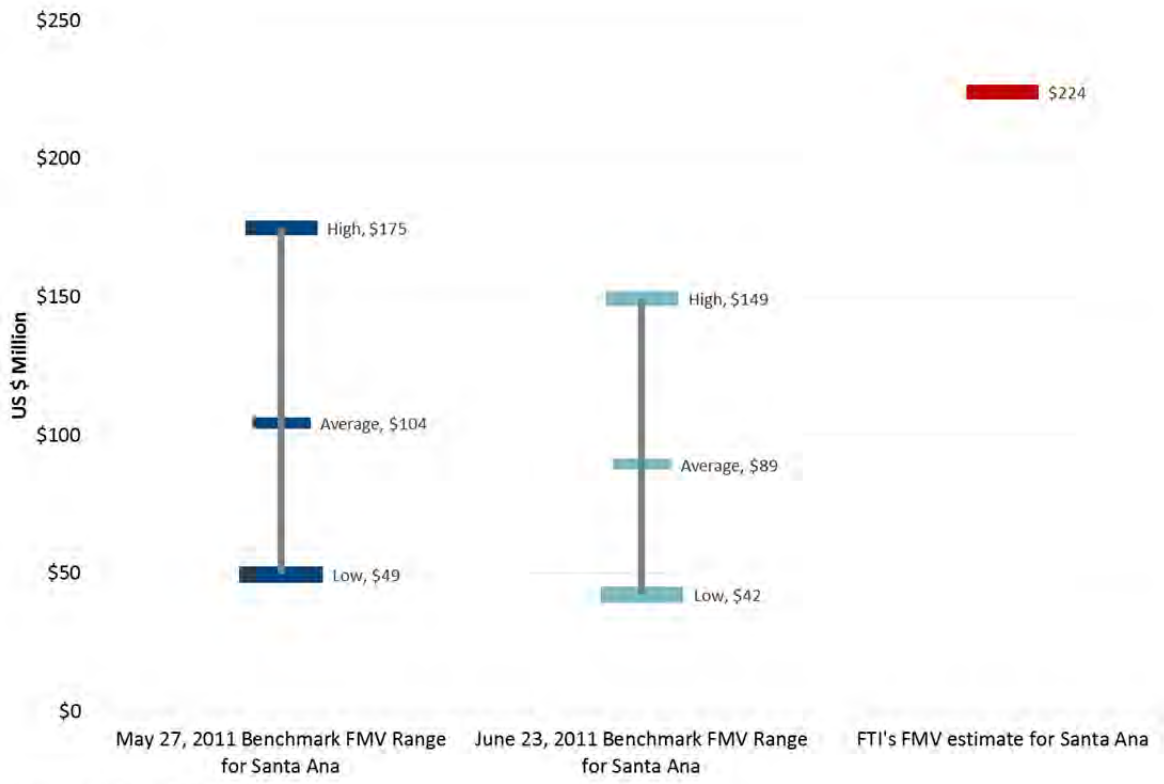
21. The same inconsistency arises under the alternative legal scenario that assumes the suspension of Santa Ana's Environmental Impact Assessment study (EIA) on May 30, 2011 was a treaty breach. Using Bear Creek's EV as of May 27, 2011, the business day before the EIA suspension, indicates that FTI overstated Santa Ana's FMV by the same order of magnitude as at June 23, 2011.[11] The inconsistency is illustrated for both dates in Figure 1.

Continued from previous page

The value of these assets combined is small and does not create a material error in the approximate value.

[11] As we explain below, the market value calculated as of May 27, 2011 should be adjusted for non-breaching events between the calculation date and the valuation date.

Figure 1. FTI's Estimate of Santa Ana's FMV Is Inconsistent with the Market Benchmark Derived from Bear Creek's Share Price



Sources: Table 3 and Table 4.

22. FTI dismissed the market information provided by Bear Creek's share price as irrelevant to its damages assessment for Santa Ana based on the extraordinary assumption that Bear Creek's share price does not reflect the FMV of its productive assets.[12] There is no economic support for this assumption.

23. First, FTI suggests that sentiment and momentum drive Bear Creek's share price, making it irrelevant as a measure of FMV. This leads to the implausible conclusion that the same is true for any publicly traded company in the world. FTI does not establish why investors would be unable to value a well-traded mining company like Bear Creek, with extensive public information about its projects available and a solid analyst following.

24. FTI's argument is also internally inconsistent because its DCF valuation for Santa Ana also relies on exchange-traded share prices. The equity risk premium and the beta estimates, the

[12] FTI indicates two other reasons, which we discuss as well in the report (Sections II.C.1 and II.C.4) and show that cannot justify its decision to not reconcile the Santa Ana FMV estimate against the market benchmark.

main components of FTI's measure of project risk, are based on the share prices of publicly traded companies, including mining companies. If FTI doubts their reliability, it should not rely on the DCF estimates of Santa Ana's FMV either.

25. Second, FTI points, without evidence, to illiquidity as potential cause for Bear Creek's share price to misrepresent the FMV of the company's assets. The argument works only if Bear Creek's assets, Corani and Santa Ana, are less liquid that its traded shares. This is not credible – there is far less trading in whole mining projects than in stocks, even for a thinly traded public company. Bear Creek however was not a thinly traded company – it was a member of the S&P/TSX Venture Select Index and, adjusted for shares outstanding, traded as frequently as BHP Billiton, Barrick Gold, and Rio Tinto, three of the largest mining companies in the world.

26. Inconsistency with a market benchmark is not the only reason to doubt the reliability of FTI's valuation for Santa Ana. The simple DCF method that it employed is not well suited to value mining projects, for which more modern techniques, sometimes called "modern DCF" or "real options", generally produce more precise valuations. Indeed, even within the framework of FTI's simple DCF method, several errors compound to overstate the already imprecise result.

27. First, according to SRK,[13] the mine plans and cost projections on which FTI relied are internally inconsistent and reflect calculation errors. They overstate total silver production and understate mining costs. Second, economic research indicates also that on average, feasibility study projections understate capital expenditures, particularly for relatively small projects such as Santa Ana. Third, SRK finds that FTI's DCF projections understate the time necessary to advance the project to the production stage under typical permitting, engineering, and social conditions. Fourth, FTI's project timeline does not reflect any expectation of delays due to the community opposition facing the Project at the Valuation Date. We find that Peru projects that had faced social opposition had been delayed by up to five years. Finally, FTI's DCF model erroneously assumes no expected change in fiscal terms and other policies toward the Peruvian mining sector despite the market indications that the incoming President of Peru would increase taxes for mining projects.

---

[13] Expert Report of Neal Rigby, SRK Consulting, October 6, 2015 ("SRK Report").

28. These errors in FTI's model have sizable effects on its estimate. We were asked to quantify the effect of correcting these errors when a reliable correction could be made with the available information. These calculations are shown in Table 1.

Table 1. Impact of Corrections to FTI's Santa Ana FMV Estimate (Extended Life Case) ($ Million)

	Revised Inputs for Santa Ana Extended Life Case DCF	NPV Based on FTI's DCF Model	Impact of Correction Relative to Previous Line	Percent Change
[1]	FTI NPV	224		
[2]	SRK Inputs	178	(46)	-20%
[3]	SRK Inputs and 14% Capex Overrun	170	(9)	-5%
[4]	SRK Inputs, 1 Year Delay and 14% Increase in Capex	134	(35)	-21%
[5]	SRK Inputs, 4 Year Delay and 14% Increase in Capex	70	(64)	-47%

[2]: Workpaper 22 - A1.
[3]: Workpaper 22 - B1.
[4]: Workpaper 22 - C1.
[5]: Workpaper 22 - D1.

29. There are other errors and imprecisions which are more difficult to correct, primarily associated with the proper accounting for cash flow risk. We do not attempt to make adjustments for these because the simple DCF model is not well suited to accommodate them. We note that those corrections can have large impacts and could increase or decrease the adjusted numbers shown in Table 1.

30. FTI's reliance on its simple DCF model at the expense of consistency with the market benchmark that FTI itself used to calculate Corani damages cannot be justified. It is not supported by theoretical or empirical economic evidence, it is undermined by reliance on biased inputs, and overstates the FMV of the Project.

2. Corani Damages

31. Claimant's calculation of damages for the Corani project rests on a double inconsistency. First, although FTI was instructed to assess the loss of value *to date*, its calculation stops on June 27, 2011 and reflects no developments between that date and the date of the FTI Report. At most, FTI's calculation reflects the loss in the market value of Corani immediately after Santa Ana was expropriated, which is admittedly not what FTI was instructed to calculate.

32. We conducted a review of the developments related to Corani between June 2011 and September 2015 to assess whether the Corani project, which Bear Creek continues to own and develop, has suffered losses to date. Claimant stated that the loss of value to Corani was due to three factors caused by the Santa Ana alleged breaches: difficulty attracting financing due to the increase in outside capital, delays caused by these financing difficulties, and an increase in the market perception of the risk of illegal acts by Respondent against Corani.

33. We find that the factors put forward by Claimant have not caused a realized loss to Corani to date. Bear Creek has not yet started financing for the project so it could not have incurred higher financing costs. After the Santa Ana alleged illegal expropriation, Claimant has not identified any illegal act that the Government took to interfere with Corani's development. Finally, although the project was delayed, the delay was caused by Bear Creek's decision to pursue engineering optimization in an environment of sharply decreased commodity prices. According to Bear Creek, this strategy paid off and increased the profitability of the project, which suggests that the delay did not cause a loss.

34. Although no realized loss has occurred to date, it is possible that Corani's current market value is lower than it would have been absent Respondent's alleged breaches because of market expectations of future losses linked to Respondent's alleged illegal actions. We term these unrealized losses. Our analysis reveals that while immediately after the Santa Ana alleged illegal expropriation, Corani's market value was affected negatively, as were the market values of other mining projects in Peru, that initial reaction was reversed.

35. At the time of the alleged breaches, the political situation in Peru was subject to change and uncertainty. While the Government actions related to Santa Ana were taken by the outgoing government, any future government action relevant to Corani would be driven by the new government to be formed by newly elected President Humala. As of June 27, 2011, the last date reflected in FTI's calculation, President Humala had not named his cabinet. Once the new cabinet was announced however, several weeks later, both Bear Creek's share price and that of other mining companies with assets in Peru increased, reflecting the market perception that President Humala's choices for key cabinet positions had moderate policy positions.

36. This initial reversal in market values is an illustration why FTI's focus on the immediate market reaction does not capture the loss to date in the market value of Corani. In addition to the short-term reversal in market values, the admitted support that the Corani project

has received from both the Peruvian government and the local communities do not support a claim that by now, a reduction in Corani's market value would persist because of continued expectations of loss due to government actions.

37. The second inconsistency in Claimant's calculation of damages for Corani is FTI's contradictory assumption that Santa Ana was worth $104.3 million when calculating damages for Corani but it was worth $224.2 million when calculating damages for Santa Ana. FTI attempts to explain this inconsistency by arguing that Bear Creek's share price reflected less than half of Santa Ana's FMV. As we explained in our discussion of using Bear Creek's share price to develop a benchmark for Santa Ana's FMV, such a discrepancy cannot be explained by the factors that FTI propose.

38. Moreover, FTI's measure of damages to Corani is based on the change in Bear Creek's share price due to the alleged breaches. If the share price can measure the loss of value to Corani correctly, then FTI must assume that it is only the Santa Ana project that is mis-valued by the market and not Corani. This striking assumption has no justification because investors have more information about Santa Ana, which is a more advanced and less complex project than Corani.

3. Claimant's Amount Invested in Santa Ana

39. We have been instructed to calculate the quantum of damages based on Claimant's amount of investment in the Project. We base our calculation of the investment amount on Bear Creek's publicly available financial statements, which are prepared in accordance with Canadian Generally Accepted Accounting Principles. Bear Creek's financial statements identify the exploration costs that the company has reported it incurred to acquire and develop the Project. As of June 30, 2011, these costs total $21,827,687, as presented in more detail in Section IV.

4. Pre-Award Interest

40. We calculate pre-award interest based on a commercially reasonable rate in U.S. dollars as provided for by the Free Trade Agreement between Canada and the Republic of Peru. Commercial rates depend on the time value of money and the borrower's credit risk. Because the award amount would be owed by Respondent, a relevant benchmark is the commercial rate that reflects Respondent's credit risk. We estimate the compensation for the time value of money using the yield on short-term U.S. Treasury bills. We then add the credit risk premium estimated from rates on credit default swaps on Respondent's sovereign debt denominated in U.S. dollars. The total pre-award interest between the Valuation Date

and September 24, 2015 is 2.79% of the damages amount. This corresponds to an average annual interest rate of 0.65%.

41. We present also pre-award interest calculations based on the risk-free rate, which is also a commercial rate, under an alternative scenario in which Claimant is entitled only to compensation for the time value of money and not for risk. This is a legal question that hinges on whether the risks borne by the Claimant before the award are better characterized as litigation risks, and if so, whether compensation for litigation risk should be awarded. We do not opine on this legal question. Under this theory, the total pre-award interest as of September 24, 2015 is 0.69%, corresponding to an average annual interest rate of approximately 0.16%.

42. Claimant's theory of pre-award interest coincides with our first calculation, which includes compensation for Respondent's credit risk. There should be no disagreement therefore between our calculations and FTI's. FTI however did not use a commercial rate and instead used a monetary policy interest rate for operations in Peruvian currency published by the Central Reserve Bank of Peru. This is simply the wrong rate and cannot form the basis for calculating interest at a commercially reasonable rate for an amount denominated in U.S. dollars.

II. Santa Ana Damages

A. Damages Standard and Valuation Date

43. The FTA provides that compensation for an expropriation "shall be equivalent to the fair market value of the expropriated investments immediately before the expropriation took place ('date of expropriation'), and shall not reflect any change in value occurring because the intended expropriation had become known earlier."[14] We have applied this standard.

44. The date as of which the FMV of Santa Ana should be determined is June 24, 2011 (Valuation Date), the day immediately before the alleged expropriation took place through the issuance of Supreme Decree 032.[15] Information regarding the forthcoming decree, however, was known the day prior. The FTA instructs that the FMV calculation should exclude any effect of that information. The valuation cannot simply be performed one day

[14] Canada-Peru FTA (C-01), Article 812, ¶ 2.

[15] Supreme Decree 032 was issued on June 25, 2011 (C-05: Supreme Decree No. 032-2011-EM).

earlier, however, because other factors that caused the Project FMV to change prior to the Valuation Date should be reflected in the valuation.

45. Claimant alleges that the suspension of Santa Ana's EIA process on May 30, 2011 also constituted a treaty breach.[16] While we understand that the treaty does not define compensation for non-expropriatory breaches, the same economic framework can be applied. In this case, the calculation of Santa Ana's FMV as of the Valuation Date should exclude any impact of the EIA suspension. FMV should, however, reflect the impact of unrelated changes in the Project's value prior to the Valuation Date, such as those caused by market-wide or industry factors not alleged to constitute breaches of the FTA.

46. FTI chose June 23, 2011 as its valuation date (FTI Valuation Date) for Santa Ana. This choice ignores the one-day change in Santa Ana's FMV that was due to market factors other than prior knowledge of the alleged expropriation. FTI erroneously did not perform any adjustment to its FMV calculated as of June 23, 2011, but the error is small.[17]

47. A reliable method of calculating the FMV of Santa Ana must use market inputs and produce a result that is consistent with market indicators of value. FTI relied on the income approach to estimate Santa Ana's FMV, which requires estimating the Project's expected future cash flows and adjusting them for risk and the time value of money. When applied correctly using accurate inputs, the income approach can provide a reliable estimate of FMV. A reliable FMV estimate obtained this way should be reconcilable with market benchmarks obtained through other methods.

48. FTI's implementation of the income approach fails on two accounts. First, it produces an FMV estimate that cannot be reconciled with the combined market value of Bear Creek's productive assets, which is observable directly. Second, it has methodological flaws and relies on incorrect technical and economic inputs.

---

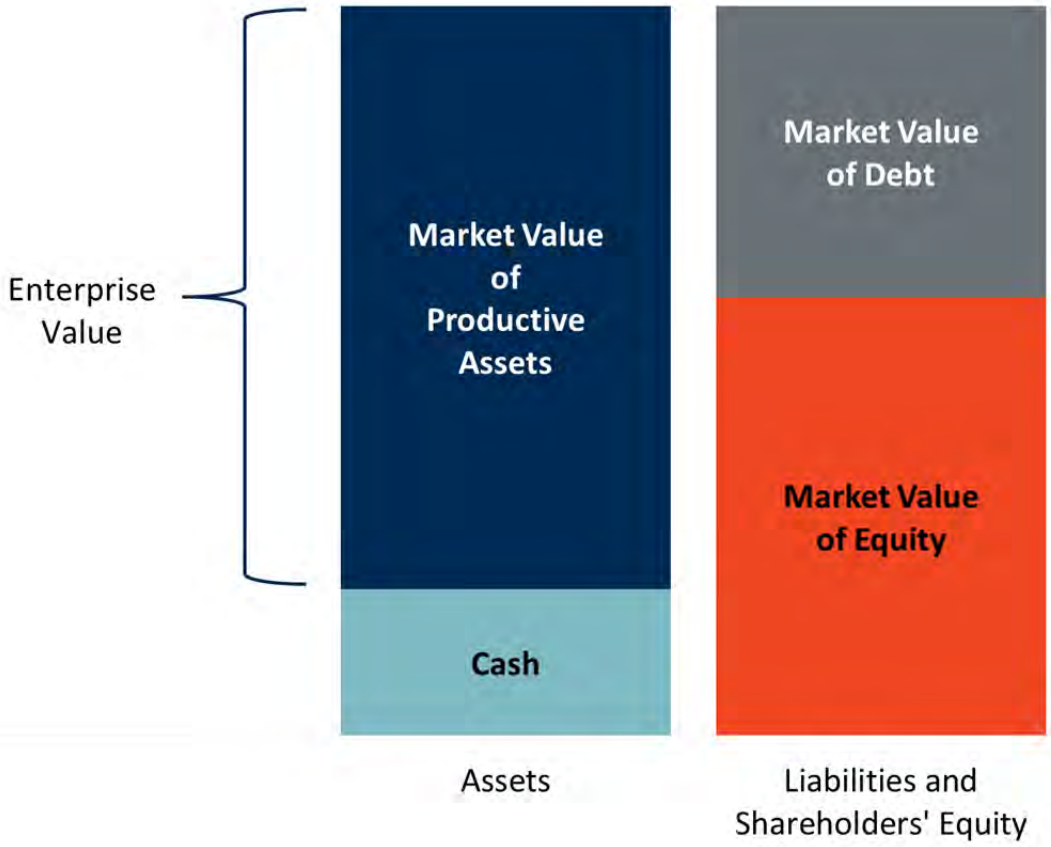
[16] Claimant's Memorial, ¶ 73.

[17] FTI's DCF valuation method relies on silver futures prices and the 20-year Treasury bond rate, which change daily. Between June 23 and June 24, 2011, the futures price curve dropped by about 1% (Workpaper 15) and the 20-year Treasury bond rate fell by 1 basis point.

B. FTI'S ESTIMATE OF SANTA ANA'S FMV CANNOT BE RECONCILED WITH BEAR CREEK'S ENTERPRISE VALUE

49. A fundamental economic principle, illustrated in Figure 2, is that the market value of a company's assets is equal to the market value of the claims on the company's assets (debt and equity).[18]

Figure 2. Enterprise Value



50. The enterprise value (EV) is the market value of a company's productive assets, shown in dark blue in Figure 2. It is calculated by subtracting the amount of cash from the market value of its equity and debt.

51. Bear Creek is publicly traded on the TSX Venture Exchange (TSXV) in Canada. Its share price on the Valuation Date therefore provides a direct measure of the combined FMV of all the company's assets, including Santa Ana. As Bear Creek had no debt at the Valuation Date, its EV is simply the market value of its equity less available cash.

---

[18] This identity is sometimes referred to as the economic balance sheet of the company. For a detailed discussion, see, for example, Holthausen, Robert W. and Mark E. Zmijewski, *Corporate Valuation: Theory, Evidence & Practice* (Cambridge Business Publishers, 2014) (BR-130), pp. 6-8.

52. The FMV of Bear Creek's equity is straightforward to determine because it is reflected in the company's share price. The owner of a 1% share in the company receives 1% of the value that the company's assets generate, either over time as they generate cash flows from production or more immediately if the company sells its assets for cash. A buyer of that 1% share, therefore, is at most willing to pay 1% of the value of the assets.[19] A seller of that 1% share likewise will accept no less than 1% of the value of the assets. If trading occurs in active markets with competing buyers and sellers, the price of that 1% share will equal 1% of the value of the assets. If a 1% stake in the company is worth 1% of the assets' value, and the price of that 1% stake is known via market information, then the total asset value as judged by the market is simply 100 times the observed price of the 1% share. This is the principle of value additivity, a foundation of finance theory.

53. Market trades in Bear Creek's shares reflect the key elements of FMV transactions. They are conducted between willing, arm's length buyers and sellers in an open and unrestricted competitive market. As shown in Table 2, Bear Creek's stock was well traded, with a daily trading volume in the range of the twenty largest mining companies in the world.

[19] If a company has debt, a share in the company would reflect the value of assets net of debt.

Table 2. Average Daily Volume as Percentage of Floating Shares Outstanding

Notes: Companies chosen represent the 20 largest mining companies by market capitalization on June 24, 2011 for all companies in the "Metals Mining" industry, as classified by Bloomberg. The benchmark companies are listed in decreasing order of their market capitalization.

54. The buyers and sellers of Bear Creek's shares had reasonable information available through the publicly available disclosures made by Bear Creek pursuant to Canadian securities

regulations,[20] as well as through analyses published by multiple analysts at major financial institutions.[21] Bear Creek's shareholders were large investors with experience in the mining industry and the resources to analyze the available information effectively.[22] Its largest shareholder shortly after the Valuation Date was Silver Wheaton, an experienced silver market player, who held 14.4% of Bear Creek's shares.[23] The second largest shareholder, with a 10.1% share, was Sprott Asset Management, a large investment company with $9 billion in assets under management (AUM) and an active owner and trader of mining shares.[24]

55. Bear Creek's share price provides a reliable and direct measure of the FMV of its projects. If Santa Ana were Bear Creek's only project, then its FMV would be equal to the company's EV.[25] Bear Creek also owned Corani, so the company's EV reflects the combined FMV of both assets. Knowing the relative value of the two projects, however, would make the calculation of each asset's FMV possible. For example, knowing that Corani's FMV is four times Santa Ana's FMV implies that Santa Ana's FMV is 20% of the company's EV.[26]

---

[20] These include disclosure rules applicable generally to listed companies, such as NP 51-201 - Disclosure Standards (BR-107) and NI 51-102 - Continuous Disclosure Obligations (BR-108), and rules applicable specifically to mining companies, such as NI 43-101 - Standards of Disclosure for Mineral Projects (BR-106).

[21] For example, FTI identified seven analysts who were following the company (FTI Report, Appendix 8).

[22] Bear Creek's CEO, Mr. Swarthout, described the share ownership as follows: "we have a very strong long-term institutional investor group comprising probably 60% to 70% … [t]hese groups are all very sophisticated investment funds." Bear Creek Mining Corp, "Special Call," June 2, 2015 (BR-132), p. 3.

[23] S&P Capital IQ, Bear Creek Mining Corp. Public Ownership History, June 30, 2011 (BR-112).

[24] Sprott AUM as of June 30, 2011. Sprott Inc., *Report to Shareholders*, June 30, 2011 (BR-29), p. 8. Sprott's Canadian Equity Fund, for example, had a total NAV of $1.5 billion as of September 30, 2011, a majority of which was constituted by metals and mining companies. See "Sprott Canadian Equity Fund: Quarterly Portfolio Disclosure as at September 30, 2011" (BR-28), p. 1.

[25] To be precise, equating the single project's FMV to the company's EV would result in a small overstatement because the EV reflects also the possibility that the company would identify positive NPV projects in the future.

[26] As Bear Creek also owned several other properties, this method tends to overstate Santa Ana's FMV. However, the effect is small because Bear Creek's other assets (Tassa, La Yegua, Alejandra, and Sumi), were all early-stage exploration properties. Bear Creek Mining Corporation, *Bear Creek Mining Corporation Interim Consolidated Financial Statements, First Quarter ended March 31, 2011,* May 25, 2011 (BR-11), Note 8.

56. An estimate of the ratio of the two projects' market values is available. Indeed FTI used a method relying on ratios to calculate the market value of Corani.[27] Using the relative value of Santa Ana and Corani implied by the valuations published by seven analysts, FTI estimated that Santa Ana represented 19.2% of Bear Creek's EV, with a range from 9.1% to 32.2%.[28] The average 19.2% share implies a benchmark value for Santa Ana of $104.3 million as of May 27, 2011.[29]

57. FTI ignored this market-based benchmark and instead used an income approach to conclude that Santa Ana's FMV was $224.2 million, more than double the EV approach.[30] The magnitude of FTI's inconsistency is illustrated in Table 3. Not only is FTI's $224.2 million FMV estimate as of the FTI Valuation Date more than double the value of Santa Ana FTI itself used in valuing Corani (middle column of Table 3), it is 28% higher than the high end of the range defined by the analyst estimates of the relative value of Santa Ana and Corani. There is no economic justification for this discrepancy.

Table 3. FTI's Santa Ana FMV Estimate versus Market Benchmark, May 27, 2011 (US$ Million)

Bear Creek EV at May 27, 2011	[1]	543.5		
		Low	Average	High
FTI Estimate of Santa Ana Share of EV	[2]	9.1%	19.2%	32.2%
Implied Santa Ana FMV at June 23, 2011	[3]	49.5	104.3	175.0
FTI Estimate of Santa Ana FMV	[4]	224.2	224.2	224.2
Excess above Benchmark FMV ($ million)	[5]	174.7	119.9	49.2
Excess above Benchmark FMV (%)	[6]	353%	115%	28%

[29] FTI Report, Figure 27.

[30] FTI Report, Figure 2.

EIA suspension is determined to be a treaty breach.[31] In the alternative damages scenario in which only the expropriation is determined to be a breach, the benchmark value should be calculated based on Bear Creek's EV as of June 23, 2011.[32] This further magnifies the amount by which FTI's FMV estimate exceeds the market benchmark. As shown in Table 4, at the average estimate of relative values, FTI's valuation for Santa Ana is 150% higher than the benchmark market value. At the high end of the range, it is 50% over the benchmark market value.

Table 4. FTI's Santa Ana FMV Estimate versus Market Benchmark, June 23, 2011 (US$ Million)

Bear Creek EV at June 23, 2011	[1]	464.0		
		Low	Average	High
FTI Estimate of Santa Ana Share of EV	[2]	9.1%	19.2%	32.2%
Implied Benchmark for Santa Ana FMV	[3]	42.2	89.1	149.4
FTI Estimate of Santa Ana FMV	[4]	224.2	224.2	224.2
Excess above Benchmark FMV ($ million)	[5]	182.0	135.1	74.8
Excess above Benchmark FMV (%)	[6]	431%	152%	50%

59. The market benchmark in row 3 of Table 3 and Table 4 that we use to test FTI's estimate of the value of Santa Ana is not itself a precise estimate of Santa Ana's FMV, but it is indicative of the range of values where the true FMV is likely to lie. The benchmark incorporates imprecise estimates of the relative value of the two projects, based on analyst calculations.[33] In principle, a comprehensive, modern discounted cash flow (DCF) analysis

[31] As explained in Section II.A, the May 27 value should be adjusted to reflect the effect of market changes other than the impact of the alleged breaches until the FTI Valuation Date. In its calculation of Corani damages, FTI used the change in the TSX Global Mining Index over the period (FTI Report, ¶ 8.5.). Because the index decreased after May 27, 2011, applying a similar adjustment to Bear Creek's EV would only magnify the discrepancy between FTI's FMV estimate and the market benchmark.

[32] The result would then be adjusted to the Valuation Date (June 24) by an adjustment reflecting market changes unrelated to the expropriation.

[33] Some additional error is caused by not subtracting the value of Bear Creek's other properties from the EV. As we discussed above, those properties were at the early stages of exploration and unlikely to

Continued on next page

can be used to value the two individual assets (Santa Ana and Corani).[34] The resulting values could be tested (in total) against the observable EV of Bear Creek at the valuation date to ensure consistency with that market value. If the total did not match the observable EV, there are calibration mechanisms that can be undertaken. A more precise ratio of value attributed to Santa Ana could then be determined.

60. A reliable modern DCF analysis would require detailed and project-specific cost and risk estimates. It would also incorporate Monte Carlo simulation to reflect the impact of uncertainty about future commodity prices and to capture non-linear interactions between different uncertain cash flow determinants.[35] Such an analysis would require substantial supporting analyses and inputs beyond those developed by Claimant's experts. In the absence of these necessary inputs, the measure based on the analysts' approximation of the relative market value of Santa Ana and Corani offers a useful indication of FMV against which to test the reasonableness of FTI's result.

61. To be clear, we do not suggest that the individual asset values calculated by the analysts are reliable. Their methods are simplistic and have flaws, and the range of asset values that results is large. Some of the valuations appear to be contingent on project success and produce values for a future (target) date, while others make *ad hoc* adjustments for risks. We do not rely on these reports for the specific values, but rather only for the relative value of the Santa Ana and Corani assets. While analyst valuations overstate the two projects' contemporaneous combined FMV (which we can see directly in the market),[36]

Continued from previous page

have a substantial market value. In any case, correcting this source of imprecision would only magnify the inconsistency between FTI's conclusion and the market benchmark.

[34] The modern DCF method is also known as the "real options" valuation method. It is an implementation of the income approach to valuation that avoids the shortcomings of the simple DCF method that FTI used, accounts for risk more reliably, and can measure the value of management decision-making in response to changes in the future economic environment. We discuss this in Section II.D.1.

[35] Monte Carlo simulation involves generating a large number of possible future cash flow streams according to statistical models that capture the variability in different cash flows components (e.g., metal prices, fuel costs, realization of inferred resources) and calculating the asset's present value by averaging the present value across all the simulated paths. See, for example, Brealey, Richard A, Stewart C. Myers and Franklin Allen, *Principles of Corporate Finance*, Tenth edition ("Brealey and Myers, 10th ed.") (BR-128), pp. 249-253.

[36] For example, the four reports published in June 2011 prior to the Valuation Date calculate combined values in excess of $1 billion (FTI Report, Figure 26), while Bear Creek's EV over the period did not exceed $500 million (FTI-03).

each analyst used consistent assumptions across the two projects. Consistency in valuation assumptions across projects implies that the error in measuring the relative value is small compared to the error in the individual asset valuations.

62. To illustrate this concept, consider Canaccord's analyst valuations, which use a "peak silver" price of $47.50.[37] Because this is above the price the market expected,[38] all else constant, Canaccord's DCF model overstates each project's FMV. But because both projects' FMVs are inflated, their *relative* valuations are subject to a smaller error. Similarly, each analyst uses the same fiscal term assumptions for both projects, but some reports reflect the likelihood of increased taxation following the election of President Humala and some do not.[39] Both assumptions cannot be right on a given date, but because each analyst values Corani and Santa Ana using the same rate, the error in the relative value will not be of the same magnitude as that in the individual asset valuations.

C. FTI's Failure to Reconcile Its FMV Estimate of Santa Ana with Bear Creek's Share Price Is Unjustified

63. FTI did not reconcile the striking difference between its DCF estimate of Santa Ana's FMV and the range of market values implied by Bear Creek's share price.[40] FTI instead dismissed Bear Creek's share price as "not … [a] sufficiently reliable measure to determine the FMV of the Project at the Valuation [Date]."[41] We discuss the reasons provided by FTI for its decision to ignore Bear Creek's share price as a relevant benchmark. These reasons cannot justify FTI's argument to ignore Bear Creek's traded value.

---

[37] Campbell, Nicholas and Gabriel Gonzalez, Canaccord Genuity Analyst Report, June 7, 2011 (FTI-56), p.1.

[38] The Canaccord analyst labels this a peak-silver price and adjusts the resulting NAVPS (net asset value per share) of Bear Creek downward to offset the overstatement of value. Campbell, Nicholas, Canaccord Genuity Analyst Report, June 7, 2011 (FTI-56), p. 3. It is more than twice Canaccord's own institutional silver price forecast TD Bank, "Commodity Price Research Estimates," June 25, 2011, p. 2 (FTI-29).

[39] Specifically, Canaccord and Paradigm Capital make adjustments related to increased taxation risk. Blyth, Don, et al., Paradigm Capital Inc Analyst Report, June 8, 2011 (FTI-55), pp. 2-3. Campbell, Nicholas, Canaccord Genuity Analyst Report, June 7, 2011 (FTI-56), pp. 1, 4.

[40] See Table 3 and Table 4 above for the calculation of the difference.

[41] FTI Report, ¶ 7.69.

1. Bear Creek's Ownership of Multiple Projects

64. The first reason offered by FTI for not relying on Bear Creek's share price is that Bear Creek owned other assets, "the value of which would need to be determined and deducted to arrive at the FMV of the project."[42] This view is inconsistent with how FTI calculated damages for Corani.

65. To calculate damages for Corani, FTI apportioned the combined value of Bear Creek's assets into two parts: 19.2% for Santa Ana and 80.8% for Corani. To claim that the same could not be done to calculate damages for Santa Ana is contradictory.

66. Beyond Santa Ana and Corani, FTI stated that any other assets amounted only to "an immaterial balance."[43] The inability to value these other admittedly immaterial assets, therefore, cannot justify failure to use EV and to reconcile with it values from other methods.

2. Sentiment and Momentum

67. FTI argues that "[p]ublicly traded share prices of junior mining companies like Bear Creek may not be representative of the FMV of the underlying mineral properties they own due to a number of factors."[44] FTI then identifies two factors, the first being "[s]entiment and momentum."[45]

68. Bear Creek was listed on a major Canadian stock exchange and was subject to securities disclosure rules. Mining companies have transparent reporting requirements, as documented in the NI 43-101, NP 51-201, and NI 51-102 standards for disclosure of material information.[46] Due to these extensive regulatory disclosure requirements, mining companies are among the most transparent businesses in the market today. For example, every material item of asset inventory must be disclosed and every material change in business environment announced.[47] In essence, to argue that the market cannot correctly

---

[42] FTI Report, ¶ 7.69 (i).

[46] National Instrument 43-101 – Standards of Disclosure for Mineral Projects (BR-106); National Policy 51-201 – Disclosure Standards (BR-107); National Instrument 51-102 – Continuous Disclosure Obligations (BR-108).

[47] NP 51-201 (BR-107), Part 2.1; NI 43-101 (BR-106), Article 4.1.

value Bear Creek's two major assets is to conclude that the market cannot correctly value any asset on any listed stock exchange.

69. If one rejects the stock market's ability to compute the value of assets like Santa Ana and Corani, for which there were extensive, publicly available technical reports outlining projected production quantities and costs for each asset, one must also reject the proposition that the share prices of companies like General Motors or United Airlines reflect fair market value. Indeed the market has less information as to the likely future cash flow generation or strategic plans for these companies than it did for Bear Creek.

70. This is an extraordinary view of the relevance of public stock markets, at odds with their central importance in all developed economies and with mainstream financial economics. Consider as an example the advice from the world's leading corporate finance textbook, *Principles of Corporate Finance*:

> Our two examples of gold and copper producers are illustrations of a universal principle of finance: When you have the market value of an asset, *use it*, at least as a starting point in your analysis.[48]

71. FTI's view of public markets is also internally inconsistent. FTI's Santa Ana FMV estimate relies on prices of financial assets traded in public markets.

    a. Silver and gold price projections rely on futures prices,[49] which reflect public trading on COMEX.

    b. FTI's beta estimate, a key measure of cash flow risk that affects the project discount rate, is based on the publicly traded share prices of U.S. precious metal mining companies and the S&P 500 stock index, an average of 500 U.S. stocks.[50]

    c. Professor Damodaran's equity risk premium used by FTI, another key component of the discount rate, is calculated from closing prices of the publicly traded companies included in the S&P 500 stock index.[51]

72. Price projections and the discount rate are key inputs into the DCF method. Doubt as to their economic relevance would also cast doubt on the relevance of FTI's DCF calculations.

---

[49] FTI Report, ¶ 7.47.

[50] FTI Report, ¶¶ A5.21-22.

[51] FTI Report, ¶ A5.16-17.

3. Illiquidity and Trading Ease

73. The second reason that FTI offers to explain why Bear Creek's share prices may not reflect the FMV of its assets is illiquidity.[52] Illiquidity can affect market prices, but it is not plausible that for Bear Creek's stock it is a significant factor that could explain substantial underpricing of Bear Creek's assets.

74. Bear Creek's mining assets are *less* liquid than its traded shares. If anything, a potential buyer of the Santa Ana property would require a *discount* relative to the value implied by Bear Creek's share price, rather than a premium, as FTI argues.

75. Our analysis of average daily trading volume, presented in Table 2 above, shows in any case that Bear Creek shares were trading in volumes similar (proportionately) to those of the largest mining companies in the world. For example, as a fraction of floating shares outstanding, Bear Creek's trading volume was about the same as BHP Billiton, Rio Tinto, and Barrick Gold, three of the five largest mining companies in the world by market capitalization in 2011.

76. Bear Creek's stock was also included by Standard & Poor's (S&P) in its S&P/TSX Venture Select index, which included only 30 of the approximately 2,400 companies listed on the TSXV.[53] This also indicates sufficient liquidity in Bear Creek's shares, and S&P specifically cites liquidity as a condition for inclusion in the Select index.[54]

4. Impact of Respondent's Actions

77. FTI argues that the share price is not "a sufficiently reliable measure to determine FMV," because it "may have reflected the impact from the Respondent's actions, or other factors (i.e., protests) prior to the Valuation Date."[55] That argument also does not support ignoring EV.

78. First, the impact of Respondent's actions can be accounted for, if necessary, by using share prices before the alleged treaty breaches occurred, and adjusting the resulting valuation for

---

[52] FTI Report, ¶ 7.69 (ii) (2).

[53] TSX VXTC Index Stock File as of May 31, 2011 (BR-115); TMX Group – Equity Financings Statistics June 2011 (BR-111).

[54] As of 2014, S&P required that "[i]ndex constituents … have adequate liquidity" (S&P/TSX Venture Select Index Methodology, July 2014). While it is not clear that S&P applied the same rule in 2011, Bear Creek met S&P's liquidity criteria and was included in the index in 2014, when it traded at a lower volume than in 2011 (see Table 2).

[55] FTI Report, ¶ 7.69, 7.69 iii.

the impact of unrelated factors until the Valuation Date. FTI employs a similar approach in its assessment of damages to Corani.[56]

79. Second, FTI does not explain why the impact of community protests should be excluded from the FMV calculation. Community opposition can cause project delays, increase costs to the company, or even prevent a project from being developed.[57] Unless there is a presumption that the State has a treaty obligation to quash all protests and eliminate any community opposition to projects, which we are instructed is not an appropriate legal position, accounting for the impact of social opposition is critical to obtaining a reliable measure of damages. This provides an example of how using the share price as a starting point for the valuation provides timely signals about the market impact of project-specific factors that can otherwise be difficult to quantify reliably.

80. Third, if there is a prior alleged breach, the correct approach is to identify and value the impact of that breach or, if legally appropriate, to change the valuation date. It is not economically valid to use the possibility of an unspecified past breach for which Claimant does not seek to hold Peru liable to argue that less precise methods should replace observable traded public values at a later date. That is to say, the method chosen must be capable of identifying the impact of the alleged breaches and to reconcile the valuation with the public market data. It is not meaningful to use a valuation that clearly exceeds the value in public markets based on a hypothesis that there may be earlier impacts that might constitute breaches and that possibly suppressed that value in some indeterminate way.

D. FTI's DCF Calculation Is Unreliable

81. Faced with a substantial difference between its DCF estimate and the FMV benchmark implied by Bear Creek's share price, FTI ignored the market-based indicator and relied exclusively on the inflated DCF result. FTI's confidence in its DCF valuation, despite its large deviation from EV benchmark, is misplaced. The market-based value given by Bear Creek's share price, although imprecise because of its reliance on an approximate split of value between the two projects, however, is more reliable than FTI's DCF result.

---

[56] To adjust the value of the Corani project between May 27 and June 27, 2011, FTI applied a 7.3% reduction equal to the fall in the S&P/TSX Global Mining Index over that period (FTI Report, ¶ 8.5 (i)).

[57] We present evidence of the impact of delays on mining projects in Peru in Section II.D.2.b below.

82. FTI's DCF calculation is unreliable for three reasons: (i) the simple DCF implementation that FTI used is not well suited to the valuation of a mining project like Santa Ana ii) FTI relied on inaccurate technical inputs from RPA, and (iii) FTI made several economic errors.

1. Shortcomings of the Simple DCF Method Employed by FTI

83. The simple DCF method that FTI used has two basic steps. The first is to project the components of a project's stream of cash flows to the owner over time and then combine them to derive free cash flows. These components of free cash flows include, for example, prices, quantities, capital expenditures, and operating costs. The resulting free cash flow projections must be what economists call *expected* or *unbiased* cash flows.

84. The second step is to value each of these cash flows. The valuation of the cash flows requires two distinct operations. The first is to adjust the cash flows for their timing. Later cash flows are worth less than early cash flows simply because market participants prefer a dollar today to one tomorrow, since they can invest a dollar today without risk and receive a higher amount tomorrow. That preference can be measured via bond markets. Technically, the cash flows are "discounted" for time using the risk-free rate of interest.

85. The second part of the cash flow valuation step is to further "discount" the cash flows for their risk. This second adjustment is based on the premise, which has been verified in financial markets, that investors are risk averse. That means that investors would prefer less risk to more, all else equal.

86. In general risk refers to variance or volatility around the expected value of an uncertain quantity. When adjusting expected cash flows for risk, only a certain kind of risk, called "systematic risk", matters. Systematic risk is risk that cannot be diversified by holding a portfolio with a large number of assets, in which asset-specific (or idiosyncratic) fluctuations offset each other. Because they cannot eliminate it, investors demand compensation for bearing it in the form of a commensurate expected return.[58] Therefore, assets subject to more systematic risk must offer higher expected returns to induce investors to hold them. Higher expected returns imply lower prices than less risky assets with similar cash expected flows.

---

[58] Of course investors would not mind being compensated for diversifiable risk too, but in a competitive market they cannot, because competition among investors eliminates return for risk that investors can eliminate by diversification.

87. The exact nature of this second adjustment is complex in practice due to the absence of direct market signals as to the specific level of systematic risk in a given project's free cash flows. The cash flow components of a silver mine vary significantly in their non-diversifiable risk. Revenues carry the non-diversifiable risks common to silver, whose price varies with world silver demand, which is itself a function of the level of global economic activity (and other factors), or at least those types of activity that use silver. As a "store of value" silver prices also vary with expected inflation, which is an independent source of non-diversifiable risk. Fuel costs carry the non-diversifiable risks common to oil, which also depend on the level of global economic activity, but not exactly in the same way as silver prices. Fuel costs also depend on the political stability of oil producing regions, which adds another dimension of non-diversifiable risk. The costs of machinery and labor have their own unique components of non-diversifiable risk.

88. The simple DCF model that FTI used offers a simplistic approach to the risk discounting problem: it assumes an exponentially increasing discounting of the free cash flows of the project as their time to realization becomes more distant. That is, the riskiness of the cash flows is assumed to compound over time at a constant rate (called the discount rate).

89. Modern finance has pointed out two major problems (and many minor problems) with this discounting approach.[59] First, it is unlikely that any project's cash flows will have exponentially increasing uncertainty.[60]

90. Second, there are no clear market signals as to how the risk of a particular project's free cash flows stream should be discounted. If all silver mines had the same relative amounts of revenue and costs from energy, machinery, labor, etc, then it would not matter that each component had its own discount rate. However, silver mines do vary in how much they have of each component. So there is a large degree of inaccuracy in taking a discount rate from an "average" silver mine and applying it to any particular mine. Textbook solutions

---

[59] For a detailed discussion of these problems and how a modern DCF approach can help solve them see Samis, Michael, Graham A. Davis, David Laughton, and Richard Poulin, "Valuing uncertain asset cash flows when there are no options: A real options approach," *Resources Policy* 30 (2006), pp. 285-298 (BR-122). The modern DCF approach is also appropriate when during the course of a project's life, management can make decisions that capture upside opportunities or avoid losses. Examples of such management decisions include expanding mine capacity if metal prices rise above expectations or stop or delay production if it becomes unprofitable due to declining prices or rising costs. See Brealey and Myers, 10th ed. (BR-128), Chapter 22, for an explanation of real options.

[60] Robicheck, Alexander A, and Stewart C. Myers, "Conceptual Problems in the Use of Risk-Adjusted Discount Rates," *The Journal of Finance*, Vol. 21, No. 4 (1966), pp. 727-730 (BR-126).

suggest finding a proxy asset, such as a single asset silver mining company whose only project is identical to Santa Ana, and whose observable market value can be used to measure its systematic risk.[61] This works in theory, but as FTI noted, there are no comparable properties to Santa Ana that traded over time,[62] and the hope of finding a proxy company is slim.

91. Unfortunately, the errors in discounting the project cash flows for risk can have a large impact on the resultant project valuation. If the Santa Ana project is just slightly riskier in investors' eyes than the risk of the average precious metal mining company, then applying the market risk adjustments investors use for precious metal mining companies to Santa Ana's cash flows will result in a substantial overvaluation of Santa Ana. Likewise, if Santa Ana's cash flows are on the whole less risky, the application of the market risk adjustments investors use for precious metal mining companies will result in a substantial undervaluation.

92. Beginning in the 1970s modern finance recognized that there was a solution to this risk discounting problem. The simple DCF method discounts each year's project cash flows and adds them, using a principle of finance called value additivity. Modern finance refines this approach: it discounts each cash flow component (*e.g.*, silver revenues, gold revenues, mining costs, milling costs) within each project year, and then via the principle of value additivity adds these to come up with the value of that year's cash flows.[63] It then again applies the principle of value additivity to add the values from each of the project years to come up with the value of the project.

93. The process may sound like it has just the same problems as the simple approach. How is the valuator to know how much to discount each cash flow item? Fortunately, for mining projects there are market signals telling the valuator how to do this.[64] Forward markets in

---

[61] Textbooks also warn of the difficulty of doing so. The leading corporate finance textbook, *Principles of Corporate Finance*, warns that "[y]ou cannot hope to estimate the relative risk of assets with any precision." Brealey and Myers, 10th ed. (BR-128), p. 224.

[62] FTI Report, ¶ 7.67.

[63] The approach is sometimes called "at-source" discounting for risk, because each cash flow item is adjusted for systematic risk before combining all items into free cash flows. The resulting cash flows are called certainty-equivalent cash flows.

[64] This is an important distinction – while the modern DCF can be more reliable than the simple DCF, it needs more market inputs. If market signals about the risk of the major cash flow components are not available, then the improvement in precision does not occur.

the metals, for example, tell them how to discount revenue uncertainty. In forward markets, investors agree today to exchange a unit of metal at a pre-defined future date for an agreed upon price.[65] Because that agreed upon price, called the forward price, is known today, it is already discounted for risk and requires only adjustment for the time value of money.

94. For cash flow items that do not have forward markets, proxy markets that are fairly close to the cash flow item can be found. For example, forward markets for crude oil can provide a proxy for diesel fuel forward prices.

95. The modern DCF approach may yield a higher or lower value than that determined by the simple DCF approach, depending on whether the project's cash flow components exhibit more or less risk than the broad index used in the simple analysis. This approach provides a more rigorous path to the valuation of each asset than the blunt assumptions in the simple DCF method.

96. The advantages of the modern DCF approach have been recognized by the mining industry. It is recognized by CIMVal, the Standards and Guidelines for the Valuation of Mineral Properties published by the Canadian Institute for Mining, Metallurgy and Petroleum Special Committee on Valuation of Mineral Resources, as professionally acceptable,[66] and has been used in NI 43-101 compliant technical reports for complex mining projects.[67]

97. Aside from the imprecision of the simple DCF method, which FTI could have remedied by employing a more rigorous approach as discussed above, FTI's method suffers also from several errors that magnify that imprecision. We discuss these in the next subsection.

---

[65] In a forward contract, counterparties agree on a fixed price for the future delivery (and payment) of a product. If a forward contract is traded on an exchange, it is called a futures contract. Brealey and Myers, 10th ed. (BR-128), p. 652.

2. Errors in FTI's DCF Based on RPA's Base Case

98. FTI's cash flow projections rely on technical production and cost inputs provided by RPA (RPA Report).[68] The RPA Report presents two scenarios: a Base Case and an Extended Life Case,[69] and FTI stated that the Extended Life Case "is useful for determining the FMV of the project."[70] FTI's damages conclusion is based only on the Extended Life Case, although FTI calculates also the NPV implied by the RPA's Base Case.[71]

99. We reviewed the SRK Report and we were asked to determine the impact on FTI's damages calculation if the technical errors that SRK identified in RPA's calculations are corrected as deemed appropriate by SRK. We identified several other errors, which we discuss also below, and for which we provide a more reliable estimate where possible within FTI's simple DCF framework. We note that because we cannot make corrections for all errors in FTI's calculations, the adjusted figures we present below are not corrected valuations but rather indications of the magnitude of the impact that FTI's errors that we can quantify have on its valuation. We begin with the Base Case.

a. Mine Production and Cost Projections

100. SRK concluded that both the FSU and the RPA Report made an error in calculating the appropriate cut-off grade for resources and reserve determination, resulting in a "gross overstatement of reserves."[72] As a result, according to SRK, RPA's Base Case substantially overstates the amount of reserves and the resultant mine life. SRK concluded also that RPA understated operating costs and overstated silver recovery.[73] Making no other changes to FTI's model but the corrections provided by SRK reduces FTI's result based on the Base Case by $25 million (from $191 million to $166 million).[74]

74 Workpaper 19.

101. Research shows that mining feasibility studies tend to understate capital costs, with the average mining project experiencing a 14% overrun after accounting for general inflation.[75] FTI took no steps to avoid this downward bias in capital costs. Adjusting capital expenditures to eliminate this average bias further reduces the result of FTI's DCF calculation by $8 million to $158 million.[76]

b. Timeline to Production

102. FTI's present value calculation assumes that construction would start before the end of calendar year 2011 and the first year of production would be 2013.[77] This is an aggressive timeline that, all else constant, overstates project value because it fails to account for likely delays caused by technical factors, permitting, and social opposition. In a DCF analysis delays cause asset value to decline. A DCF analysis requires the use of an unbiased expectation of the timing of future cash flows. However, the timeline used by FTI is a best-case scenario that ignores two sources of project delays.

103. First, SRK finds that the timeline on which FTI relied understates the time required to mobilize the project team, complete the detailed engineering necessary to begin construction, and obtain the necessary permits. We note that SRK's concerns are validated by evidence from Peru's expert who has reviewed the status of Bear Creek's pursuit of the required exploitation permits and landowner agreements, and who notes that, as of June 2011, Bear Creek apparently had not obtained *any* of the necessary landowner agreements and had not yet received approval of the environmental impact assessment, which is the starting point for all subsequent exploitation permits and certifications.[78] Accordingly, SRK estimates that a reasonable estimate of the additional time required to complete these steps is one year.[79] Adding one year of delay would push cash flows into the future and result in additional costs,[80] resulting in a further reduction in FTI's NPV estimate (in addition to that

---

[76] Workpaper 19.

[77] FTI Report, Schedule 1.

[78] Expert Report of Luis Rodriguez-Mariategui Canny, October 5, 2015, ¶¶ 47, 67, 107-108.

[79] SRK Report, ¶ 92.

[80] We estimate the additional annual costs by the average Santa Ana exploration costs shown in Bear Creek's financial statements for the period between project acquisition and the second quarter of 2011 (see Table 7 in Section IV). We excluded land acquisition costs and other fees associated with the purchase of the property, as these would not be incurred in the future.

implied by the adjustments that SRK made to production and cost projections). Such a one-year delay reduces FTI's calculated value by $39 million for the Base Case. The resulting Project NPV after this adjustment is $119 million.[81]

104. Second, the timeline assumes no delays due to community opposition, although at the Valuation Date the mine was subject to community opposition. SRK's estimate of an additional one year does not reflect delays due to ongoing social opposition.[82] The recent historical experience of mines in Peru, as of the Valuation Date, provides evidence of substantial delays relative to the timelines envisioned in feasibility studies when the projects subsequently face significant community opposition. Table 5 shows that projects that encountered community opposition were delayed by up to five years and out of six projects, four experienced delays in excess of four years.[83]

---

81 Workpaper 19.

82 SRK Report, ¶ 92.

83 To identify the projects included in Table 5, we started with a list of metals mining companies that reported revenues from Peru in their 2011 or 2012 financial statements, obtained from S&P Capital IQ. We then reviewed their public disclosures to identify mining projects in Peru that were either in production or had an estimated production start date as of the Valuation Date. To ensure a comprehensive coverage, we cross checked this list of projects against the largest ten mines, by 2011 production, for the following metals: silver, copper, gold, and zinc, which are commodities in which Peru has a substantial market share. For each mine that had completed a feasibility study (FS), we identified the timeline to production projected in the FS. We then compared that timeline with the actual start of production or, for mines not yet in production as of 2011, the revised projected production start date as of 2011. A complete list of the projects for which information was available is shown in Workpaper 4, including the mines that were not subject to community protests and social opposition.

Table 5. Peruvian Mining Project Delays Due to Social Opposition in Peru Prior to the Valuation Date

Project	Owner	Metals	Original Projected Start of Production	Actual Start of Production/Projected Start of Production in 2011	Calculated Delay (years)
La Zanja	Buenaventura	Gold	3Q or 4Q 2005	September 2010 - Community relations caused the delay; opposition to the project developed when environmental and health concerns arose in communities downstream from La Zanja. Opposition against the mine peaked in 2004 when protesters destroyed the exploration camp.	5
Pucamarca	Minsur	Gold, SIlver	Late 2007 to Early 2008	Production actually began on 1/12/2013, as it was stymied by community relations. In 2011, it was expected that production at Pucamarca would begin in late 2012.	4.5
Antamina	BHP Billiton/Glencore Canada	Copper, Zinc	Feb-02	Oct-01	-0.3
Tia Maria	Southern Copper/Newmont Mining	Copper	Q4 2010	The 2011 Southern Copper Annual Report states it was expected that production at Tia Maria would begin in early 2015, following the Peruvian government's rejection of the EIA in 2011 due to community resistance.	4.3
Rio Blanco	Monterrico Resources (owned by Zijin Mining)	Copper	2011	As of the 2011 Annual Report, the projected production date was 2015. This project was plagued by delays. In 2005, police allegedly shot dead one protester and tortured 30 others after they marched against the mine's construction.	4
Quellaveco	Anglo American	Copper	First Production: 2014 Full Production: 2016	As of the 2011 Anglo American Annual Report, the forecasts had been updated as follows: First Production: 2016 Full Production: 2017 The Annual Report states that "we've slowed down progress while we participate in a multi-stakeholder dialogue and work with the local communities to seek to fully understand their concerns and aspirations."	1.5
				Average Delay	3.2
				Median Delay	4.1

Source: Workpaper 4.

105. Because the Santa Ana project was subject to social opposition and community protests before the first alleged breach by Respondent, the Project's market value should be based on an expected timeline to production that reflects the impact of protests. The data in Table 5 indicate that substantial delays were likely as Bear Creek worked to obtain the social

license needed to operate. Incorporating the four-year delay typical for this group of projects into FTI's DCF calculation further lowers the resulting NPV of the Base Case to $54 million.[84]

c. Fiscal Regime

106. FTI used the fiscal assumptions in place as of the Valuation Date to calculate after-tax cash flows. These include a corporate income tax rate of 30%, a sliding scale royalty capped at 3% of Net Smelter Return (NSR), and no special taxes on mining revenues or profits.[85] These assumed fiscal terms are appropriate if they are expected to apply for the life of the Project. As of the Valuation Date however taxes and royalties for the mining sector in Peru were expected to increase. This makes FTI's fiscal terms assumptions biased upward and results in overstating the DCF result.

107. The election of President Humala on June 6, 2011 increased market expectations of higher mining taxes and royalties. While both candidates in the election had advocated tax increases, President Humala's position was perceived as more aggressive.[86] Of the seven analysts analyzed by FTI, the two who issued reports after the election results were announced indicated that an increase in taxes for the mining sector was likely.[87] The Paradigm analyst report assumed a 10% increase in income tax and a doubling of the royalty rate to 6% in its DCF model:

> With the social unrest in Peru, we had expected that taxes and royalty rates would likely be increased no matter who won the election. Given that the left-leaning candidate was victorious, we expect the rise will be more than it would have been under Keiko Fujimori … We have adjusted our financial model to assume higher taxes, royalties and permitting times.[88]

---

84 We assumed three, respectively four years of delay in total, including the additional year projected by SRK. See Workpaper 19.

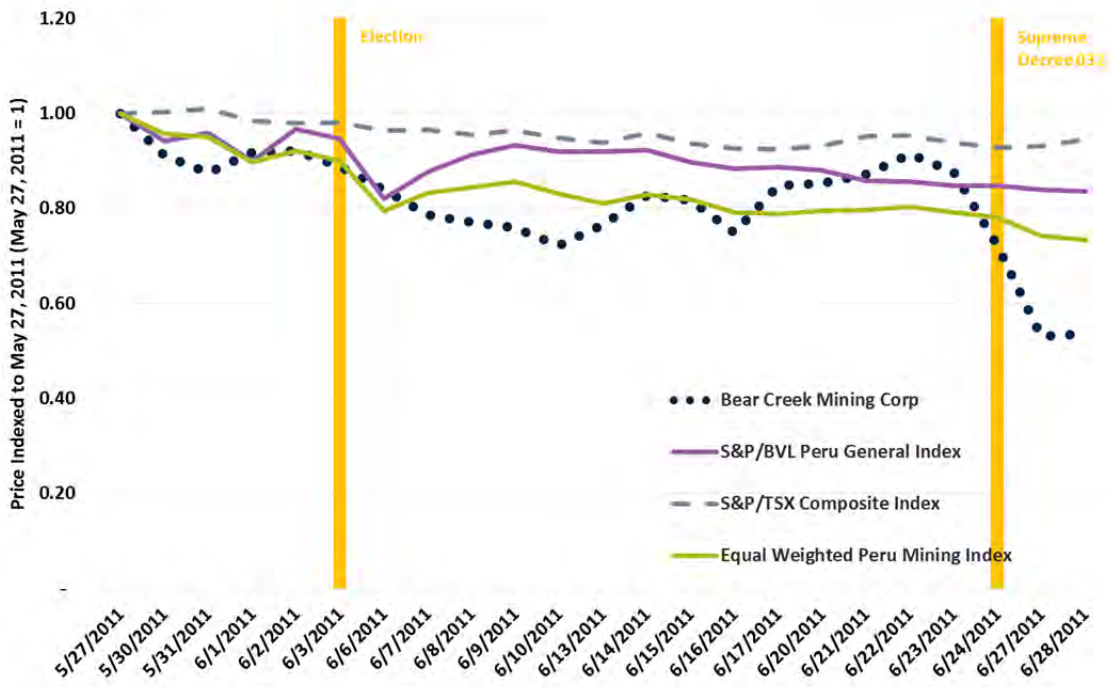
87 Paradigm Capital Analyst Report, June 8, 2011 (FTI-55), pp.1-2; Campbell, Nicholas, Canaccord Genuity Analyst Report, June 7, 2011 (FTI-56), p.1. In September 2011, a special mining tax was introduced and the royalty scheme modified from a NSR royalty to one based on operating margin. El Congreso de la República, "Ley que crea el impuesto especial a la minería," September 23, 2011 (BR-141). El Congreso de la República, "Ley que modifica la ley 28258, ley de regalia minera," September 23, 2011 (BR-142).

88 Paradigm Capital Analyst Report, June 8, 2011 (FTI-55), pp.1-2.

108. The expectation of higher taxes and royalties is consistent with the stock market reaction following the election. As shown in Figure 3, the immediate negative reaction was sharp. For mining stocks, represented by the green line,[89] there was an initial drop of 12% on June 6, followed by a partial recovery in the following days. The overall Lima stock market, shown in purple, had a more pronounced recovery, which is consistent with the expectation that the increase in taxes would affect only the mining sector.[90]

Figure 3. Peru Stock Market Reaction to June 6, 2011 Election Results



Source: Bloomberg. The Peru Mining Index is calculated based on the equal-weighted average return of 16 publicly traded companies that own assets exclusively in Peru (excluding Bear Creek). For index calculation and selection of constituents, see Workpapers 5 and 10.

109. The market and analyst reaction indicate that a worsening of fiscal terms for mining projects in Peru was likely as of the Valuation Date. By not accounting for this market expectation, FTI's DCF estimate overstates the FMV of Santa Ana. The magnitude of the

---

89 To capture the effect of events in Peru on the market value of mining projects in Peru, we developed an index of companies focused exclusively on the Peruvian mining market. The index includes 16 companies traded on the TSX, TSXV, NYSE, or BVL that own mining assets exclusively in Peru. See Workpaper 10 for selection of companies and Workpapers 5-7 for index construction.

90 The chart includes also the S&P/TSX Composite Index (dashed grey line) as a benchmark for general market movements not specific to Peru.

market reaction suggests that the impact was material, though it is not possible to estimate it without a careful analysis that FTI has not conducted.

d. Project Discount Rate

110. FTI applied a simple risk-adjusted discount rate to adjust the Project's expected cash flows for timing and risk. In the absence of a market signal for the systematic risk of Santa Ana's cash flows, FTI used an approximation based on two components.

111. The first component reflects the average risk of a group of 73 U.S. precious metal mining companies in 2010.[91] Precious metal mining is a global business, with the location of the company listing in no way reflecting the location of the company's mines. FTI's estimate therefore likely reflects a combination of risk factors from across the world to which mining companies are exposed. It is a blunt measure, as it yields the same average value for precious metals project, anywhere in the world, no matter what the metal or the differences in their exposures to systematic risk factors.

112. The second component, a country risk premium, is an attempt to customize the discount rate for projects located in Peru. This two-part approach is an *ad-hoc* method that lacks support in finance theory and has not been tested empirically.[92] Moreover, the adjustment is again blunt – there is nothing to account for differences in risk among projects within Peru, be they in the mining industry or another industry.

113. This imprecision in the estimate of the discount rate is important because small differences in risk discounting have large impacts on project value. For example, starting with FTI's result as adjusted to reflect corrections to technical inputs and four years of delay ($54 million), a 2% decrease in the discount rate increases the implied NPV by 29% (to $69 million); a 2% increase in the discount rate lowers the implied NPV by 23% to $41 million.[93]

---

[91] FTI Report, ¶¶ A5.21-22.

[92] Kruschwitz, Lutz and Andreas Loffler, Gerwald Mandl (2012), "Damodaran's Country Risk Premium: A Serious Critique," *Business Valuation Review*, 31(2/3): 75-84 (BR-121). Professor Damodaran acknowledges that the model that he proposes, which FTI used, is not derived from rigorous theoretical foundations and reflects his adjustments to models that practitioners sometimes use to accommodate the view that emerging market projects carry more risk (Damodaran, Aswath (2012), "Response to 'Damodaran's Country Risk Premium: A Serious Critique,'" *Business Valuation Review*, 31(2/3): 85-86) (BR-120).

[93] Workpaper 19.

114. For all of these reasons there is merit when textbooks advise that one should use market signals like share prices when one has them,[94] as is the case here.

e. Silver Price Projections

115. FTI's silver price projections reflect an inconsistent mix of futures and spot prices. For the period through December 2015, FTI's price forecast relies on futures prices. After that, FTI uses an average of historical spot prices, analyst forecasts, and futures prices to calculate a long-run silver price of $22.21/oz in real 2011 dollars.[95] The long-run price reflects only a 1.5% weighting on futures prices, so that the price series goes from relying 100% on futures prices in 2015 to only relying on them 1.5% in 2016.

116. The mix of futures and spot prices is inconsistent with finance principles. Futures contracts guarantee a price for delivery of silver at some future time. Because the futures price is guaranteed, it is not subject to risk from spot price fluctuations. Accordingly, futures prices reflect no risk – if futures prices are used in a DCF analysis, the appropriate discount rate is the risk-free rate.[96] Spot prices however, are not fixed and vary day to day, exposing an investor to systematic risk. In the DCF framework used by FTI, which adjusts for systematic risk through the discount rate, revenue projections should be based on expected spot prices to avoid double counting.[97]

117. The end result of FTI's method is a price projection that decreases slowly for several years, then drops sharply from $30.78/oz in 2015 to $22.21 in 2016, and then remains constant for the remaining project life.[98] The sharp projected fall in the real silver price in 2016, illustrated in Figure 4, is not consistent with commodity pricing theory. Moreover, the assumption of a constant real silver price in the long run is not supported by economic evidence. Research on the pricing of silver indicates that it is slightly mean reverting in

---

[94] Brealey and Myers, 10th ed. (BR-128), p. 273.

[95] FTI Report, Figure 19, Figure 20, and ¶ 7.47.

[96] This is only true for the price component of cash flows. If other cash flow components reflect systematic risk, they should not be discounted at the risk-free rate.

[97] FTI confuses the issue by presuming that futures prices should be used because they are the "actual market prices that could be obtained at the Valuation Date for sales of silver…" and that Bear Creek would have used futures contracts to hedge its commodity price risk (FTI Report, ¶¶ 7.28-29). It is well known in finance that the market value of an asset is the same whether or not the firm sells its production forward (Black 1976). That is, hedging decisions by a firm neither create nor destroy value, so whether Bear Creek planned to hedge its future sales or not is irrelevant to Santa Ana's FMV.

[98] FTI Report, Figure 21.

nominal terms, which means that it tends toward a long-run *constant nominal* value, which implies a *declining real* value.[99] FTI's constant real price assumption implies a rising nominal price of silver, as shown in Figure 4. It is hard to quantify FTI's error without generating a rigorous model for silver prices, but based on observed futures prices the overall effect of FTI's inconsistent assumptions appears to be to understate prices in the short-run and overstate them, in the long-run.

Figure 4: FTI Silver Forecasts

Source: Bloomberg, FTI Report pp. 48 - 49, ¶94, Workpaper 17.

118. FTI also implemented its DCF model under an alternative price forecast, which it stated was consistent with the methodology adopted by the Tribunal in another investment arbitration.[100] In this alternative approach, FTI assumed a *constant real* silver price equal to the real futures price in December 2015. In contrast, the Tribunal in the case FTI refers to

---

[99] Casassus, Jaime, and Pierre Collin-Dufresne (2005), "Stochastic Convenience Yield Implied from Commodity Futures and Interest Rates," *The Journal of Finance* 60(5): 2283-2331 (BR-119); Bessembinder, Hendrik and Jay F. Coughenour, Paul J. Seguin, and Margaret Monroe Smoller (1995), "Mean Reversion in Equilibrium Asset Prices: Evidence form the Futures Term Structure," *The Journal of Finance* 50(1): 361-375 (BR-117).

[100] FTI Report, Schedule 2 and ¶ 7.50.

adopted a method that assumed a *constant nominal* silver price.[101] FTI therefore inflated its price projection without support – had it followed the authority it cites, it would have used a decreasing real price projection.[102]

119. In addition, in this alternative scenario that relies only on futures prices, FTI did not adjust its discount rate downwards, even though by using futures prices it has adjusted for a large portion of the risk of the project. The value of Santa Ana under this alternative scenario would thus be higher than $333 million if this error were corrected, making it even more difficult to reconcile with Bear Creek's EV of $543 million (reflecting both Santa Ana and Corani) and highlighting that FTI's assumptions combine to overstate Santa Ana's FMV.

3. Errors in FTI's DCF Model Based on RPA's Extended Life Case

120. RPA's Extended Life Case adds 35 million tonnes of additional low grade resource (as opposed to reserves) in the production.[103] The additional material comes from lowering the resource pit cutoff grade from 17.5 g/t to 14 g/t, indicative of a higher price scenario for the life of the mine compared with the base case. The lower cutoff grade increases the number of economic blocks of resource.

121. Unlike in the base case, RPA does not run a Whittle Pit Optimization on the resource material in this extended case and thus does not estimate year by year tonnages or grades.[104] In the absence of a Whittle Pit Optimization one also cannot estimate which blocks of resource are economic to recover once stripping and waste movement are taken into account. RPA simply assume that 75% of the additional material would be economic to

---

[101] The Gold Reserve award cited by FTI states that the DCF model on which it relied assumed a constant copper price equal to $3.55, which it states was the price as of April 2008 for the futures contract with delivery June 2010 (FTI-27, ¶ 836). This is a nominal price, unadjusted for inflation, unlike FTI's projected price (the longest maturity futures price available from Bloomberg is $3.553 for the contract expiring March 2010; the discrepancy between the maturity dates however does not imply that the June 2010 futures contract would have been priced at $3.55 in real 2008 dollars because the futures contract on the London Metals Exchange for delivery June 2010 had a lower, not higher price than $3.55; for $3.55 to be in real dollars, the nominal futures price for the June 2010 contract would have to have been higher). If the Tribunal in Gold Reserve intended to rely on a constant real price, therefore, that price would have been lower than $3.55, given the expected inflation rate of 2.39% also selected by the Tribunal in that case (FTI-27, ¶ 838).

[102] FTI Report, Figure 22 and Schedule 2.

[103] RPA Report, Tables 14-2, 14-3.

[104] SRK Report, ¶¶ 118-119.

mine, and that 0.81 tonnes of waste must be mined for each tonne of ore.[105] Neither of these numbers is supported by an engineering analysis. SRK find that this approach of adding low grade resources to the end of the mine life is "far too simplistic" and, by assuming a 75% conversion of resources to mined material, it represents "a deliberate strategy to inflate value."[106]

122. The same CIMVal standards and guidelines that FTI frequently cites states are clear that when resources are included in the income approach, "the technical and related parameters used must be estimated or confirmed by one or more Qualified Persons and a qualifying statement must be included in the Valuation Report about the confidence level of the technical and related parameters relative to Feasibility Study or Prefeasibility Study confidence level."[107] That means that there must be some qualifying statement about stripping ratios, grades, tonnages, recoveries, and other factors that affect cash flow and hence value. The RPA report includes no qualifying statements, and simply presents in Appendix B a flat-line projection of the technical aspects of this additional material without providing an explanation for the projections.

123. Not only is the additional resource material not subjected to a Whittle pit optimization, but it includes Inferred Resources. FTI correctly defines resources as a concentration of material that has "reasonable prospects for eventual economic extraction."[108] An important distinction exists, however, between Measured and Indicated (M&I) Resources and resources classified as Inferred Resources. Although FTI quoted the extensive caveats that CIMVal provides about including inferred resources in valuation, it provided no justification for its decision to do so. CIMVal requires that the inclusion of Inferred Resources in valuation "must be justified in the Valuation Report and treated appropriately for the higher risk or uncertainty of Inferred Mineral resources compared to Measured and Indicated Mineral Resources."[109] FTI referred only to RPA's statement that "dilution and extraction factors were applied to the Mineral Resources and the Extended Life material was reduced by 25% to account for the uncertainty of future conversion to Mineral

Reserves."[110] RPA's description does not indicate that Inferred Resources were treated differently than Measured and Indicated Resources, as CIMVAL requires to reflect their higher level of geological uncertainty.

124. The inclusion of Inferred Resources in an income approach valuation is controversial. NI43-101 disclosure standards prohibit the use of Inferred Resources in a Feasibility Study,[111] and CIMVal discourages their use.[112] If included they must be treated differently than M&I Resources, with care to adjust for their speculative nature.[113] The CIM Definition Standards in place in June 2011 state that "Due to the uncertainty that may be attached to Inferred Mineral Resources, it cannot be assumed that all or any part of an Inferred Mineral Resource will be upgraded to an Indicated or Measured Mineral Resource as a result of continued exploration. Confidence in the estimate is insufficient to allow the meaningful application of technical and economic parameters or to enable an evaluation of economic viability worthy of public disclosure. Inferred Mineral resources must be excluded from estimates forming the basis of feasibility or other economic studies."[114] Rather than exclude Inferred Resources, or at least treat them differently from Measured and Indicated Resources by applying a separate risk factor, RPA simply assumes that 75% of the entire 47 million tonnes of the Measured, Indicated, and Inferred resource is mineable and indeed mined. This results in a conversion rate of 87.1% from the resource pit to mined material. SRK note that "This is … yet another gross overstatement."[115]

125. In summary, RPA's Extended Life Case simply tacks on low grade resource material to the base case, without proper engineering and economic assessment, and is thus rendered unreliable and cannot be used as a basis for valuation. As a result, SRK concluded that the Extended Life Case was internally inconsistent and "defie[d] all reason".[116]

116 SRK Report, ¶ 84.

126. At our request, SRK produced a reasonable correction that would result in a meaningful Extended Life Case consistent with RPA's intent.[117] In that correction, SRK estimated the equivalent to RPA's Extended Life Mineral Potential,[118] only this time running the resource through a Whittle Pit Optimization that determines year by year tonnages, grades, and stripping ratios. In SRK's analysis, the stripping ratio near the end of the mine life, as the pit deepens and widens into the surrounding barren mountains, becomes greater than 3, in contrast to RPA's assumption that it remains constant at 0.81. A higher stripping ratio increases costs and decreases asset value.

127. SRK's analysis also defined the portion of the available material each year that is Inferred Resource and due to geological uncertainty. We have assumed that 50% of that material would end up being ore and 50% waste once additional drilling is conducted as the mining plan progresses.

128. Once we redo FTI's extended case with SRK's extended life mineral potential and the assumption that 100% of Measured and Indicated is mineable as ore and 50% of Inferred ore ends up as ore, and after adjusted operating costs and silver recovery assumption as in the Base Case, the Extended Life Case value calculated according to FTI's model drops from $224.2 million to $178 million, as shown in Table 6.

129. The impact of the other adjustments considered for the Base Case result in the following adjusted valuations for the Extended Life Case.

---

[117] SRK Extended Life Projections.

[118] RPA Report, Table 14-3.

Table 6. Impact of Corrections to FTI's Extended Life Case

	Revised Inputs for Santa Ana Extended Life Case DCF	NPV Based on FTI's DCF Model	Impact of Correction Relative to Previous Line	Percent Change
[1]	FTI NPV	224		
[2]	SRK Inputs	178	(46)	-20%
[3]	SRK Inputs and 14% Capex Overrun	170	(9)	-5%
[4]	SRK Inputs, 1 Year Delay and 14% Increase in Capex	134	(35)	-21%
[5]	SRK Inputs, 4 Year Delay and 14% Increase in Capex	70	(64)	-47%

[5]: Workpaper 22 - D1.

130. As in the Base Case, imprecision from the blunt risk adjustments in the discount rate and the inconsistent treatment of price projections applies to these adjustments as well. The result obtained after these corrections could understate or overstate the result that would be obtained by applying a valuation method better suited to this case.

III. Corani Damages

131. The second component of Claimant's quantum calculation reflects its argument that the alleged illegal expropriation of Santa Ana "has had and continues to have serious economic repercussions on Corani by compromising Bear Creek's ability to use cash flows from Santa Ana to develop Corani."[119] Mr. Swarthout, Bear Creek's CEO, argues that the loss of Santa Ana affected the Corani project as follows:

> The expropriation will undoubtedly make it extremely difficult for Bear Creek to obtain financing for Corani, which resulted in a significant delay in the Corani Project's development schedule pending resolution of the Santa Ana situation. Furthermore, the Government's expropriation of Santa Ana has substantially raised the risk profile associated with Corani in the eyes of mining investors because Corani is located approximately 350 kilometers

[119] Claimant's Memorial, ¶ 101.

away from Santa Ana where the Government demonstrated its willingness to sacrifice an advanced mining project to appease political activists.[120]

132. The Claimant's request for damages for Corani is intended to reflect the loss of value of Corani to date caused by the alleged breaches involving Santa Ana.[121] It is therefore critical to evaluate whether -- during the period between the alleged breaches and today -- any of the claimed harmful effects of the alleged breaches have occurred.

133. FTI acknowledged that "the full reduction in the value of Corani has not crystallized."[122] But it is striking that FTI did not evaluate whether *any* loss of value caused by the alleged breaches has crystallized. We review first the evidence of harm to date (realized loss) and then discuss the evidence of unrealized loss, i.e. loss of current market value by the *expectation* of potential future harm. We then discuss FTI's measure of damages, which relies on the ex-ante expectation of potential harm as of the date following the alleged illegal expropriation and makes no reference to subsequent events.

A. Realized Loss to Corani to Date

134. The Claimant identified three potential causes of loss: (i) an increase in financing costs due both to greater amounts of outside capital required and a higher cost for outside capital; (ii) a delay in developing the project due to lack of financing options; and (iii) an increase in market's perception of Corani's project risk arising from treaty breaches by Respondent.[123] Concerning realized loss to date, Claimant's argument poses three immediate questions:

    a. Has Bear Creek suffered increased financing costs to date?

    b. Has the project been delayed to date because of the alleged breaches? If so, did the delay result in lost project value?

    c. Has Respondent taken any illegal actions that harmed the Corani project to date?

135. As explained below, the answer to each question is "no". This establishes that no losses have been realized to date. If losses exist, they are unrealized, which we discuss in the next section.

---

[120] Witness Statement of Andrew T. Swarthout, Bear Creek Mining Corporation Claimant, v. The Republic of Peru, Respondent ("Swarthout WS"), ¶ 46.

[121] FTI states that "[w]e have been asked to quantify the reduction, to date, in the value of Corani as a result of the alleged breaches" (FTI Report, ¶ 8.2).

[122] FTI Report, ¶ 8.2.

[123] Claimant's Memorial, ¶ 56; Swarthout WS, ¶ 46; FTI Report, ¶ 8.1.

1. Increased Financing Costs

136. The answer to the first question is straightforward, because Bear Creek has not sought or obtained financing for Corani to date. As of June 2, 2015, Bear Creek had modified the engineering plan for the development of Corani and projected that construction would not begin until 2016.[124] In a special call with analysts to discuss the results of an updated feasibility study, the CEO of Bear Creek informed investors that "Bear Creek has $29 million, no debt in the treasury and has no need to raise any financing until a production decision is made for the Corani project."[125]

2. Delay

137. The Corani project has experienced a delay relative to the timeline projected in 2011.[126] The question for damages is whether that delay was caused by the alleged breaches. If so, damages may result if the delay corresponded with a worsening economic environment. If the delay was caused by other factors, however, then it would not be appropriate to claim damages as a result of the alleged breach.

138. Apart from Mr. Swarthout's testimony, Bear Creek has not provided evidence that the delay to Corani was caused by the loss of Santa Ana. It is clear, however, that at least some of the delay was caused by technical factors. Although the 2011 Feasibility Study did not envision undertaking an updated feasibility study Bear Creek decided in September 2014 to pursue optimization strategies.[127] This strategic change required it to prepare an updated Feasibility Study and to make modifications to the EIA.[128]

---

124 Bear Creek Mining Corp, "Special Call," June 2, 2015 (BR-132), pp. 4, 7.

125 Bear Creek Mining Corp, "Special Call," June 2, 2015 (BR-132), p. 3, emphasis added.

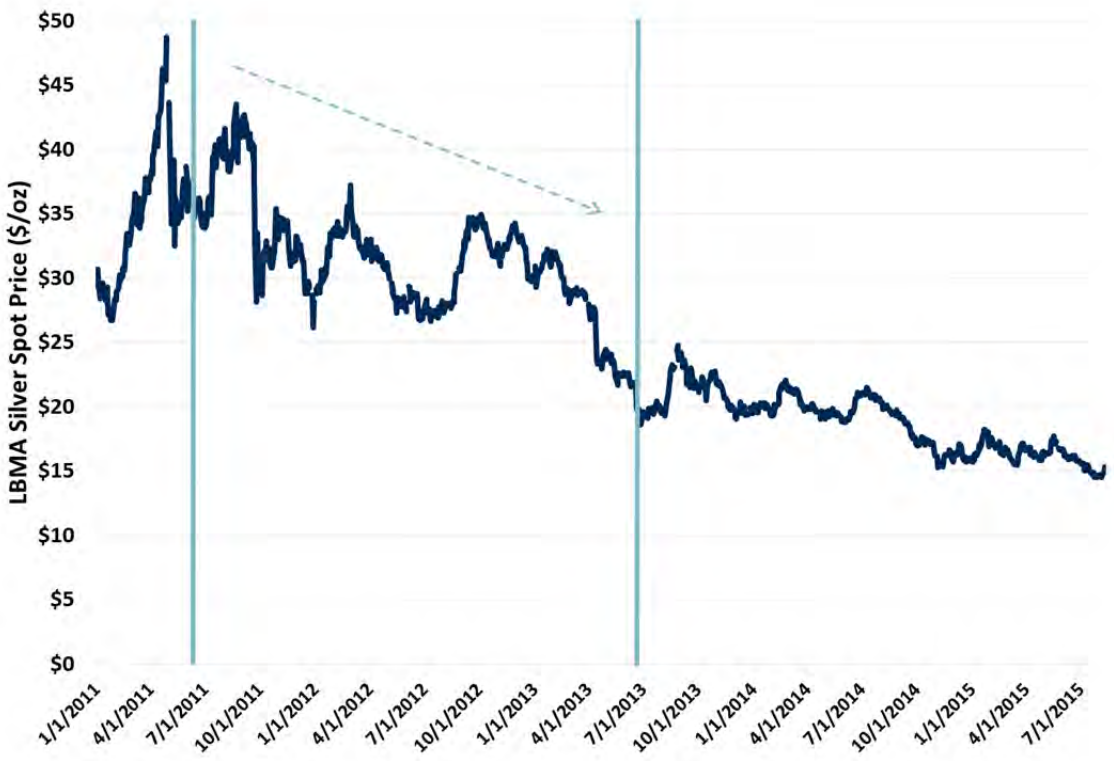
126 The 2011 Corani Feasibility Study projected production would start in 2015 (Bear Creek Mining Corp., "Special Call," November 10, 2011 (BR-131), p. 6). As of 2015, production was expected to start no sooner than 2018. Bear Creek planned to submit the amended EIA in Q3 2015 (2015 Feasibility Study (BR-104), p. 313) and plant construction was expected to begin approximately 8 months after Bear Creek received EIA approval and financing (2015 Feasibility Study (BR-104), p. 301). Construction was expected to last approximately 2 years (Bear Creek Mining Corp., "Special Call," June 2, 2015 (BR-132), p. 14).

127 "Bear Creek provides update on Corani, Peru optimization and detailed engineering progress; Several significant opportunities to be incorporated into detailed engineering," September 8 2014, SEDAR (BR-78).

128 "Bear Creek provides update on Corani, Peru optimization and detailed engineering progress; Several significant opportunities to be incorporated into detailed engineering," September 8 2014, SEDAR (BR-78).

139. It is not unusual for mining companies to re-evaluate engineering options when market conditions change.[129] As shown in Figure 5, by mid-2013, the silver spot price had fallen from above $30/oz at the time the 2011 Corani Feasibility Study was prepared to approximately $20/oz. This would have affected negatively the economics of the Corani project, creating the need to seek cost reductions through technical optimization.

Figure 5. LMBA Silver Spot Price 2011-2015 (US$/oz)



Source: Bloomberg.

140. As a public company, Bear Creek was obligated to disclose material facts to investors. But Bear Creek did not disclose to investors any view that the decision to pursue optimization strategies was caused by the loss of Santa Ana. Instead, prior to 2013 Bear Creek consistently maintained that Corani was on schedule and that it was not affected by the events at Santa Ana. There is no mention of delays or financing difficulties in the Corani

[129] For example, Buenaventura, a Peruvian mining company, had to identify ways to improve efficiency to offset the decreased revenue from falling commodity prices at several of its projects: "Buenaventura has been studying ways to lower costs at its operations as metal prices decline, Mr. Benavides said. He said the company identified areas to improve efficiency at its Uchucchacua silver mine, and is now looking at how to cut costs at its Orcopampa gold mine;" the company indicated that declining metal prices could further impact development plans at its Minas Conga gold-copper project as well. "Peru's Buenaventura: Conga Project May Be Complicated by Low Mineral Prices", April 25, 2013 (BR-85).

Feasibility Study issued in December 2011,[130] nor in the company's 2011 annual report,[131] company news releases or other public statements. To the contrary, Bear Creek stated publicly that it saw no impact of the Santa Ana events on the Corani project. In a special call with analysts on June 27, the Monday after the issuance of Supreme Decree 032, Bear Creek's CEO stated:

> Corani is unaffected by the actions taken by the government or the protests and is on track for completion of the Feasibility Study …. So I think Corani can move forward, regardless of what we do, whether it's seek a political solution to Santa Ana or legal recourse. So Corani, we don't see the timeline as affected … So I would say our 2014 goal is still valid.[132]

141. As of August 2012, the company anticipated starting production at Corani in 2015, with full scale production in 2016,[133] in line with the timeline presented in the 2011 Feasibility Study. The EIA was scheduled to be submitted in September 2012 and approval was anticipated by the end of 2013.[134] In December 2012, Bear Creek stated that the mine was still on track to begin production in 2015 and that the company would advance its financing plan in 2013.[135]

142. The company reaffirmed that Corani was on schedule in April 2013.[136] The EIA was approved by the Ministry of Mines in September 2013, in line with company's expectations

---

130 For example, the study's conclusion about finance risks states only that "Significant raises in the long-term financing charges could affect the cost of capital needed for the start of operation" and makes no mention of risks arising from the loss of Santa Ana. (Corani 2011 Feasibility Study (C-0066), Section 25.3.6)

131 The 2011 Annual report notes only that "Construction of the Corani mine will require financing either by way of share issuance, debt financing and/or by other financing alternatives to meet the projected $574 million capital requirement for the project" (Bear Creek Mining Corp. 2011 Annual Report, Management Discussion and Analysis (BR-03), p. 22). The management discussion makes no reference to any impact on Corani of the Santa Ana developments.

135 "Bear Creek submits Corani ESIA; silver project on track for approval," December 11 2012, SEDAR (BR-77).

136 "Bear Creek announces positive Corani public hearing and life of mine community investment agreements; Large scale silver project on track for approval," SEDAR, April 15, 2013 (BR-80).

when it began the approval process.[137] It was not until that point that Bear Creek first mentioned a connection between Corani's financing ability and the return of Santa Ana to the company.[138]

143. Subsequently however, in a special call with analysts in May 2014, Bear Creek's CEO once again stated that "[w]e have Corani moving forward totally uninterfered by this Santa Ana process."[139] In its June 2015 MD&A Bear Creek states that "The Company believes it has maintained good working relationships with the local communities and has continued to operate development activities at Corani without interruption."[140]

144. Bear Creek's decision to delay Corani may have been driven by a desire to avoid developing both projects at the same time, if Santa Ana was returned to the company, rather than by a lack of financing.[141]

145. Then, once the decision to pursue an updated Feasibility Study was taken, at some point before September 2014, the timeline was affected because of the time required to complete the study and need to make modifications to the EIA.[142] This delay was the result of a decision by Bear Creek to conduct an updated Feasibility Study and not by the alleged breaches by Respondent. The 2015 Corani Feasibility Study outlines the need for the updated study:

> A scoping level study was completed in 2008 for the Project and a pre-feasibility level study in 2009. In 2011, a NI 43-101 compliant feasibility study was prepared followed by additional optimization work. This updated feasibility study documents the culmination of the optimization work to investigate and reduce the capital costs, raise the internal rate of return, and

138 "Bear Creek Announces Approval of Corani ESIA, Peru," September 25 2013, SEDAR (BR-79).

139 Bear Creek Mining Corp, "Special Call," May 14 2014 (BR-134), p. 4 (emphasis added).

140 Bear Creek Mining Corporation, Management Discussion and Analysis, Quarter Ended June 30, 2015 (BR-01), p. 13.

141 "It really depends on market conditions, how quickly both of these projects move in parallel. And then at the appropriate time, we need to look at how long we would have to delay Corani. I can tell you, I think that we don't want to build both projects at the same time. But if we can accelerate Santa Ana, that becomes a real consideration, but we don't know the answer to that today." Bear Creek Mining Corp, "Special Call," May 14 2014 (BR-134), p. 7.

142 "Bear Creek provides update on Corani, Peru optimization and detailed engineering progress; Several significant opportunities to be incorporated into detailed engineering," September 8 2014 (BR-78).

> to reduce risk by streamlining the project and performing additional engineering and optimization of the site layout.[143]

146. Moreover, there is no indication that the delay harmed Bear Creek. To the contrary, according to Bear Creek's President and CEO, taking the time to do the updated feasibility study:

> "created a more compact, efficient and cost-effective operation with a smaller physical and environmental footprint, which we expect will result in a shorter and less costly path to permitting. We were able to further refine the geo-metallurgical model and mine sequencing, which led to an 8% increase in overall silver recovery with a 7% increase in silver reporting to the lead concentrate relative to zinc, partially offsetting the effects of the small ore reserve reduction….As a result of a reduction in total capital costs and optimization of the metallurgy and mine plan, the key financial metrics of the Corani project were significantly improved…"[144]

147. The press release includes a table showing how the value of the project as calculated in the feasibility studies has risen from 2011 to 2015.[145]

3. Respondent Interference

148. The third factor that Bear Creek has identified as a cause of loss to Corani is the increased threat of illegal government action. Bear Creek has not identified any action by the Peruvian government directed at Corani that has interfered with its development and would constitute a breach of the FTA.

149. To the contrary, the Corani project received its EIA approval within the expected time frame, and Bear Creek acknowledged the support of the government entities involved in the approval process.[146] Similarly, the company has maintained strong community support

---

143 2015 Updated Corani Feasibility Study (BR-104), p. 22 (emphasis added).

144 "Bear Creek Mining Announces Results of Updated Corani Feasibility Study," Bear Creek June 2, 2015 news release (BR-75), p. 2.

145 "Bear Creek Mining Announces Results of Updated Corani Feasibility Study," Bear Creek June 2, 2015 news release (BR-75), p. 2.

146 FTI submitted the EIA application for Corani to Peruvian authorities in December 2012 and received the approval in September 2013, noting that "[t]he Company received strong support from the local communities and the various Peruvian Ministries, including the Peruvian Ministry of Energy and Mines ('MEM'), during the approval process." Bear Creek Mining Corporation, Management Discussion and Analysis for the Year Ended December 31, 2013 (BR-02), p. 4.

for the project and has disclosed no indication to date that social opposition to the project could result in government actions similar to the alleged breaches related to Santa Ana.

150. In summary, there is no evidence that Bear Creek has actually experienced (realized) any loss to date driven by increased financing costs, delays related to the Santa Ana alleged breaches, or interference by Respondent. In the absence of such evidence, the only loss that Claimant could have suffered to date is an unrealized loss through a reduction in the market value of the Corani project. We discuss this potential value reduction next.

B. UNREALIZED LOSS TO CORANI TO DATE

151. We now turn to the evidence regarding Claimant's belief that the three factors discussed above (increased financing needs and costs, delay, and heightened market perception of project risk) are *expected* by the market to occur at some future point, resulting in a reduction Corani's current market value compared to the but for case. We do not find evidence that Corani's market value today has been reduced by Respondent's alleged breaches.

1. Increased Financing Costs and Delay

152. For Corani's market value to fall because of an increase in expected financing costs and delays to the project timeline, two facts would have to be established: first, that the loss of Santa Ana was expected to increase financing costs and cause delays to Corani, and second, that the expectation of these increased costs and delay is relevant to Corani's market value.

153. It is important to distinguish between the value of Corani *if Bear Creek continues to own it* and the *market value* of Corani. Corani's market value, which is the price that willing buyers in a competitive market would pay Bear Creek for the project, is not necessarily equal to what the project is worth if Bear Creek continues to own it and does not sell it. If, as a result of losing the cash flows from Santa Ana's production, Bear Creek has difficulty obtaining financing,[147] Bear Creek could mitigate those losses by selling the project to a buyer who does not face such financing difficulties.[148] As long as the expropriation of Santa

---

[147] "The expropriation will undoubtedly make it extremely difficult for Bear Creek to obtain financing for Corani, which resulted in significant delay in the Corani Project's development schedule pending resolution of the Santa Ana situation" (Swarthout WS, ¶ 46).

[148] FTI recognizes this point, and yet ignores it in its analysis simply because it has not happened (FTI Report ¶ 8.2). Yet FTI's definition of FMV (¶ 7.3) relies on the hypothetical that the market value of an asset is at all times what it would trade for in an open and unrestricted market (*i.e.*, competitive), not necessarily what it is in the hands of the current owner.

Ana had no effect on potential buyers' access to financing or available cash resources (therefore implying no delay if the project were in their hands), the events at Santa Ana would not have had an impact on these buyers' willingness to pay for Corani.[149]

154. Consider an illustrative example. Suppose we owned a plot of land in downtown Manhattan, on which we grow tomatoes. The value of the land to us, if we plan to keep growing tomatoes, is much lower than if we sold it to a real estate developer. It would not make sense to claim that the land has little market value because growing tomatoes is not particularly profitable. The land's market value would be determined by its traded or tradeable value in its more profitable use as commercial or residential real estate. Moreover, if the prospect of a lengthy drought lowered the profit from growing tomatoes, it would not make sense to conclude that it caused a decrease in the land's market value.

155. Bear Creek's unsubstantiated argument that the loss of Santa Ana made it difficult for Bear Creek to finance the Corani project and resulted in delays does not imply that Corani's market value was affected. There is an active market for development stage mining properties and major mining companies regularly buy properties from juniors.[150] If Bear Creek faced substantial difficulties financing Corani because of the loss of Santa Ana, or for any other reason, it could have avoided or substantially mitigated a consequent loss by selling the project (or brining in a partner to develop it).

156. An increase in the amount of outside financing does not necessarily imply a loss to Bear Creek from the additional financing costs. Basic financial economics principles imply that while borrowing (or issuing equity) has explicit costs (*e.g.*, interest expense or dividends to the new shareholders), using internal funds is also costly because of their opportunity cost. It is an economic fallacy to argue, for example, that by using internal funds a company is "saving" the interest expense of borrowing the same amount, because the internal funds could have been invested and generated returns. Those potential returns, foregone if the

---

[149] A decrease in the project's value to Bear Creek could affect its selling price if there were no or limited competition among potential buyers. Claimant has provided no evidence that this was the case and the presence of a large number of mining companies in Peru, including silver mining companies, suggests that if Bear Creek tried to sell Corani it would have benefitted from competition among multiple buyers.

[150] For example, of 100 randomly chosen junior mining companies listed on the Australian Stock Exchange in 2004, 10 were acquired by other companies in the following 10 years. Of the remainder, 28 went into production, 6 went bankrupt, 4 switched to oil and gas exploration, and 52 were still listed as junior companies. (Schodde, Richard, "Survival rates and the financial performance of Australian junior explorers," Ausimm Bulletin) (BR-125).

funds are used to finance an internal project, are a real economic cost. To conclude that outside financing is more expensive requires comparing the cost of external financing with the expected return that Bear Creek could earn by investing in investments of the same risk as the Corani project (this is referred to as the cost of capital). But since Corani's cost of capital is driven by Corani's risk, and since in general equal risk implies equal expected returns, it is not clear that Bear Creek would have suffered a loss from having to raise more external funds Corani compared to using retained earnings instead.[151]

157. Bear Creek's public statements following the loss of Santa Ana are also inconsistent with an expectation of loss to Corani due to increased financing costs or needs. Bear Creek did not disclose to investors that Corani, now its only substantial project, faced material delays or increased costs, suggesting that either Bear Creek had no concerns about these issues, or it deemed them immaterial.[152]

158. Under Canadian securities regulations, Bear Creek's management was under an obligation to disclose any material negative impact of Santa Ana on Corani's value.[153] A loss in Corani project's value of $170 million due to unexpected delays and increased financing costs, as estimated by FTI,[154] would be material. Not only did Bear Creek not disclose any such impact immediately after the Santa Ana events, it did not do so upon releasing the results of the Corani Feasibility Study in November 2011. At that time, Bear Creek discussed the

---

151 Asymmetric information between outside investors and firm management can make outside financing more expensive, as predicted by the so-called "pecking order" theory of capital structure (Brealey and Myers, 10th ed. (BR-128), pp. 460-462). For Bear Creek however asymmetric information is unlikely to be a major problem because of the information available publicly about the firm's projects. See our discussion of the availability of information for Bear Creek's investors in Section II.B.

152 See our discussion in Section III.A.

153 In order to maintain the listing privilege on TSX Venture Exchange a company must fulfill a number of requirements on a continuing basis, including timely disclosure of material information. TSX defines material information as "any information relating to the business and affairs of an Issuer that results in or would reasonably be expected to result in a significant change in the market price or value of any of the Issuer's Listed Shares, and includes Material Facts and Material Changes." TSX Venture Corporate Finance Policy 3.3 Timely Disclosure, Section 2.1 (BR-109). "An Issuer must disclose Material Information concerning its business and affairs immediately after management of the Issuer becomes aware of the existence of Material Information, or in the case of information previously known, upon it becoming apparent that the information is material." TSX Venture Corporate Finance Policy 3.3 Timely Disclosure, Section 3.1 (BR-109).

154 FTI Report, Figure 2.

need for financing in optimistic terms and restated the expectation that construction would begin in 2014 with commercial production beginning in 2015.[155]

159. Finally, the increase in outside financing that the loss of cash flows from Santa Ana could have caused was relatively small, because Santa Ana's revenue was small relative to the projected construction cost of the much larger Corani project. The free cash flows from Santa Ana (estimated by Bear Creek at $68 million per year) would not have been sufficient to cover the substantial construction costs of Corani (anticipated to be about $253 million per year).[156] Moreover, while the loss of Santa Ana deprived Bear Creek of that project's cash flows, it also meant Bear Creek did not incur Santa Ana's construction costs, estimated by Bear Creek at $71 million.[157] The net increase in outside financing caused by the loss of Santa Ana, based on Bear Creek's estimates, was about $65 million, or 11% of Corani's estimated initial capital costs.[158] There is no clear reason to expect that this increase in the amount of external financing would lengthen the time or cost to obtain such financing and therefore, as Bear Creek claims, cause project delays.[159]

2. Increased Market Perception of Project Risk

160. Bear Creek argues also that the expropriation of Santa Ana generated an increase in the market's assessment of the probability that similar government actions might be taken in the future against the Corani project.[160] We agree that if such an increase in probability occurred and persisted to date, it would have reduced the value of Corani to Bear Creek and to potential buyers. Therefore it would have lowered the project's FMV (unlike the factors resulting from Bear Creek's alleged financing difficulties). Our analysis indicates

---

155 Transcript of Bear Creek Mining Corp. Special Call, Thursday, November 10, 2011 (BR-131), p. 6.

156 Bear Creek estimated Corani's total initial capital costs would have been $574 million (Swarthout WS, ¶ 46). Given that the 2011 Corani Feasibility Study anticipated that 88% of this initial capital would be incurred over a two-year period (C-0066, Section 22.5.1), the required annual capital expenditure is $253 million (88% x $574 million / 2 years).

157 *Bear Creek Mining Corporation Revised Feasibility Study Santa Ana project – Puno, Peru NI 43-101 Technical Report Update to the 21-Oct-2010 Report*, April 1, 2011(C-0061), Table 1.4.

158 Calculated as two years of Santa Ana cash flows lost ($2 x $68 million = $136 million) less Santa Ana's freed up construction costs of $71 million.

159 To put the amount in perspective, firms listed on the TSX Venture exchange, the same exchange on which bear Creek was listed, raised $7 billion in the six-month period ending June 30, 2011. TMX Group - Equity Financing Statistics June 2011 (BR-111).

160 Claimant's Memorial, ¶ 101; Swarthout WS, ¶ 46.

that such an increase in market's perception of the probability of intervention was temporary and has reversed.

161. First, there are important differences between Corani and Santa Ana that make a direct inference that the government may take adverse action to Corani for the same reasons as Santa Ana tenuous. Because Corani was not within the 50-km order zone that required a special permit, the stated reason for the government's actions against Santa Ana would not apply to Corani.[161] On Claimant's view that the expropriation of Santa Ana was driven by the government's desire to quell the violence generated by community protests,[162] that same concern is not present for Corani, which has not been subject to protests from the local communities.[163]

162. Second, Bear Creek itself emphasized publicly to investors the lack of a connection between the two projects and assured investors that the expropriation of Santa Ana created no threat to Corani. In its June 27, 2011 special call with analysts, Bear Creek's CEO stated:

> I want to emphasize that Corani is a distinctly different project. It is located in a very sparsely populated area at very high elevations. The project does not operate under a Supreme Decree … And finally it's an entirely different culture, meaning Quechua as opposed to Aymara in the South of Puno and therefore, the path forward is much, much different. We enjoy very, very solid support from the communities.[164]

163. Similarly, disclosures that Bear Creek filed with the Canadian securities regulators did not indicate a pending threat to Corani from the Santa Ana events. In particular, neither the quarterly nor the 2011 annual report published after the date of the alleged FTA breaches indicated a link between Santa Ana and Corani or an increase in the risk of the Corani project due to the Santa Ana expropriation.[165]

---

[161] Supreme Decree 032 stated that "[c]ircumstances have been made known that would imply the disappearance of the legally required conditions for the issuance [Supreme Decree 083, which granted Bear Creek the right to operate within 50 km of the border]." (C-05).

[162] See Claimant's Memorial, ¶ 73.

[163] Transcript of Bear Creek Mining Corp. Special Call, Monday, June 27, 2011 (BR-133), p. 3. Corani Project Optimized and Final Feasibility Study, May 30, 2015 (BR-104), ¶ 25.2.2, 25.2.8.

[164] Transcript of Bear Creek Mining Corp. Special Call, Monday, June 27, 2011, 2:00 pm GMT, p. 3 (BR-133), emphasis added.

[165] Bear Creek Mining Corporation Consolidated Financial Statements, Year ended December 31, 2011, March 27, 2012 (BR-13); Bear Creek Mining Corporation Interim Consolidated Financial Statements, Second Quarter ended June 30, 2011, August 15, 2011 (BR-12).

164. Over time, Bear Creek has repeatedly emphasized the strong support from the communities surrounding the Corani project. In June 2015, the company stated:

> … we can't emphasize this enough that the project enjoys not only regional and local community support, but also federal government support. And I think that our team, our CSR team has done a magnificent job of creating long-term relationships that bridge between elected mayors, et cetera, lieutenant governors. We've enjoyed solid relationships for the better part of 7 years now. And we've -- our communities, who enthusiastically embrace the EIA approval, just can't wait to see a mine built. So -- and the federal government has been very supportive of us. They point to Corani in many instances as the model for companies launching new projects for community and social relations … And they are working basically side-by-side with us.[166]

165. The continued community support does not suggest the existence of concerns that social opposition would lead the government to take actions similar to the alleged Santa Ana breaches.

166. The lack of a direct link between Santa Ana and Corani suggests that if markets perceived an increase in risk, that perception likely applied not only to Corani but to all other mining projects in Peru. In other words, if Corani's market value was affected, so was the market value of all other mining projects in Peru. Indeed, news reports following the enactment of Supreme Decree 032 indicate that stock prices of some other mining companies with investments in Peru dropped.[167] The average reaction across a broader group of mining companies with assets exclusively in Peru, captured in an equal-weighted index we developed,[168] was not substantial: the index fell 6.3%, about 3.2% more than the TSXV Index and 5.7% more than the TSX Global Mining Index changed over the same period.

167. We agree with FTI that there was a market reaction to the news of the Santa Ana expropriation.[169] That news and the market reaction, however, must be analyzed in the context of the political environment in Peru at the time. That context also is important to

---

166 Bear Creek Mining Corp, "Special Call," June 2, 2015, p. 7 (BR-132), emphasis added.

167 For example, an article published on June 27 notes that "Peru's action casts doubt on other resource operations in the country, which relies heavily on foreign investment and received about 70% of its GDP from the mining industry" ("Bear Creek Plunges Deeper on Peru Mine Dispute," Business News Network, June 27, 2011) (BR-69).

168 See Workpaper 5. Over the same window (5/23/2011 to 5/27/2011), the S&P TSX Composite Index fell 0.7%, the S&P BVL Peru General Index fell 0.9%, and the price of silver fell 5.6% on the LBMA.

169 The magnitude of the drop however is considerably smaller than that implied by FTI's estimated Corani damages.

understand why subsequent developments indicate that the initial reaction was reversed as the political situation stabilized.

168. While a new President was elected on June 6, 2011, the actions against Santa Ana were taken by the outgoing government.[170] This suggests that investors' expectations beyond the immediate term depended on their view of the President-elect and the future government. Therefore, any implications of the Santa Ana expropriation for the broader investment community were mediated by investors' expectations of the incoming President's political positions.

169. President Humala's election created an uncertain political and investment environment in its immediate aftermath.[171] There were concerns that President Humala would raise taxes for mining companies and have a generally less friendly attitude toward businesses and foreign investors.[172] Indeed, on news of President Humala's election on June 6, 2011, the Lima stock market index dropped substantially (as did Bear Creek's stock price).[173] On the same day, an index formed of publicly traded mining companies with assets exclusively in Peru fell also about 8%, as indicated by the first orange vertical line in Figure 6.[174]

---

170 "Bear Creek Mining Shares Drop after Peru Revokes Mining Permit," Dow Jones Newswires, June 27, 2011 (BR-70).

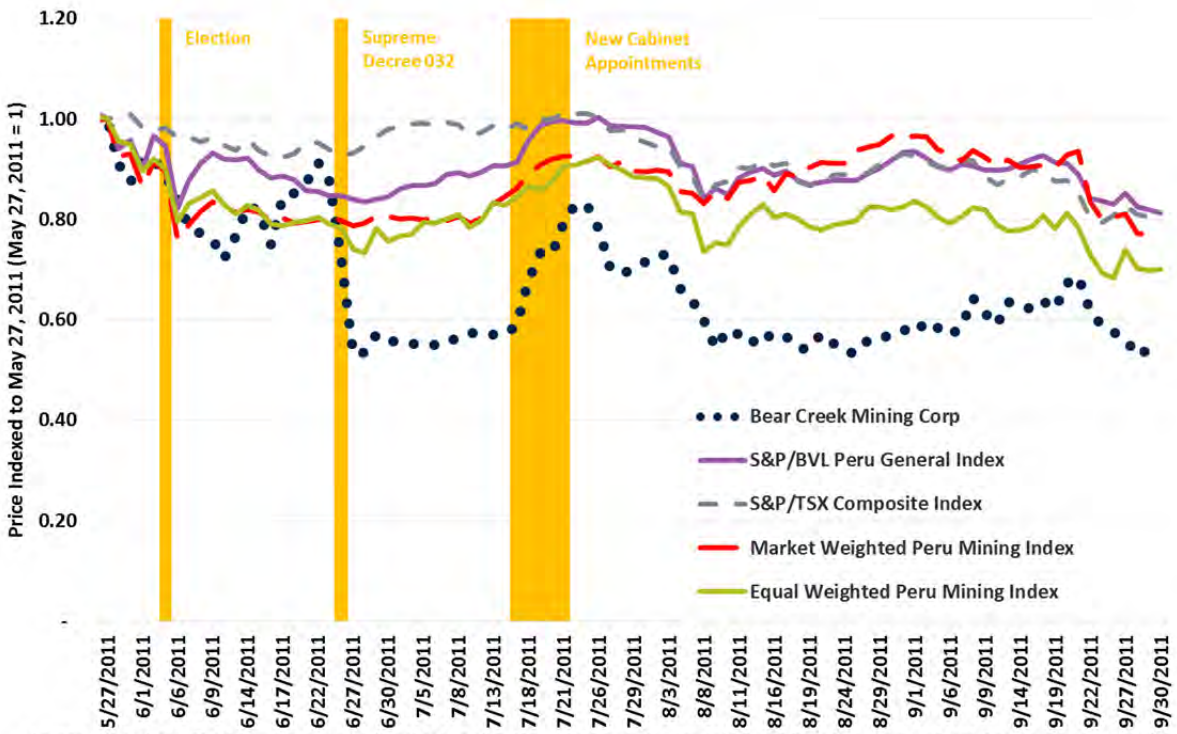
171 One analyst who covered Bear Creek's stock stated that "Ollanta Humala's edge out victory over Keiko Fujimori has cast a pale of uncertainty over investment in Peru." Campbell, Nicholas, Canaccord Genuity Analyst Report, June 7, 2011 (FTI-56), p.1.

172 Paradigm Capital Analyst Report, June 8, 2011 (FTI-55), pp.1-2; Campbell, Nicholas, Canaccord Genuity Analyst Report, June 7, 2011 (FTI-56), pp. 1, 4; "Peru's Humala edges ahead in polls; markets nervous," Reuters News, June 3, 2011 (BR-74).

173 The Lima stock price index fell 14% on June 6, 2011, when the election results were announced. Bear Creek's share price fell 5.6% on the same day, while an index comprising TSX or TSXV-listed mining companies with at least 50% of assets of 50% of revenues in Peru fell 8%. For reference, the TSX Composite fell 1.8%.

174 See Workpaper 5 for the data supporting Figure 6.

Figure 6. Bear Creek's Share Price vs. Market Indicators (Indexed to May 27, 2011)



Source: Bloomberg. The Peru Mining Index/Market Weighted Peru Mining Index are calculated based on the equal-weighted average return/ market capitalization-weighted average return of 16 publicly traded companies that own assets exclusively in Peru (excluding Bear Creek). For index calculation and selection of constituents, see Workpapers 5 and 10.

170. Subsequent to the publication of Supreme Decree 032, the market's perception of the incoming government's political views clarified, particularly after the new President appointed officials perceived as moderates by the business community to key Government positions.[175] As evidenced by the steady recovery of both the Lima stock index and the index of mining companies with exposure to Peru, market concerns about the new President's policies diminished.[176] By July 21, when the full composition of the new government was announced,[177] the Lima stock index had recovered to pre-election levels.

171. There is no evidence to date that the Corani project has suffered or is expected to suffer from harmful government actions once the new government took office. Any initial market

---

175 "Instant View – Peru President-elect Humala picks ministers," Reuters News, July 21, 2011.

176 The overall stock market shows a more pronounced recovery, particularly during the week when President Humala's cabinet appointments were made public. This reaction is consistent with the expectation that special mining taxes would be imposed, which would affect the mining sector but not the broader market.

177 "Peru's Humala: Paying Agriculture Bonds 'Doesn't Make Sense,'" Dow Jones News Service, July 21, 2011 (BR-72); "Peru's Humala names top cabinet ministers," AFP, July 21, 2011 (BR-73).

concern that was reflected in the decline in Bear Creek's share price on June 27, 2011 has not been confirmed by the government's subsequent record.[178] Indeed, as Figure 6 shows, by one month after the Santa Ana expropriation, Bear Creek's share price had recovered much of the drop recorded immediately after expropriation.[179]

C. FTI'S CALCULATION OF DAMAGES TO CORANI IS INCONSISTENT WITH ITS CONCLUSION ABOUT SANTA ANA'S FMV

172. FTI calculated unrealized damages to Corani based on the short-term change in Bear Creek's share price following the alleged breaches.[180] Specifically, FTI compared its estimated market value of Corani on June 27, 2011 absent the alleged breaches to Bear Creek's observed EV on June 27 and concluded that the difference measured the market value loss to Corani. As the method uses no information after June 27, at most it could capture the unrealized loss to Corani on that date. It cannot measure any changes in that initial loss that have occurred to date. Although FTI acknowledged that its instructions were to "quantify the reduction, *to date*, in the value of Corani,"[181] its approach ignored all developments after June 27, 2011.

173. FTI's explanation that its focus on the immediate market reaction is motivated by uncertainty about "the precise terms and amounts of financing absent versus given the alleged breaches"[182] is not logical. The future is, of course, uncertain, but the past is not. Information is known about the evolution of Corani's market value to date and should not be ignored. This information, summarized in Section III.A, indicates that none of the potential adverse effects of the Santa Ana expropriation on Corani have been realized to date. Even if the initial market reaction reflected an increased expectation of harm to Corani, as FTI argues, the lack of confirmatory evidence over the following four-year period reduced the initial concerns.

174. By focusing only on the immediate market reaction in June 2011 and ignoring subsequent developments, FTI's estimate of Corani damages is irrelevant to the standard of damages

---

178 See discussion on Section III.A.

179 While the share price fell subsequently, that fall was associated with a large market downturn in mid-August, in which all benchmarks shown in Figure 6 fell substantially.

180 Specifically, FTI used the change in Bear Creek's EV between May 27, 2011 and June 27, 2011. FTI Report, ¶ 8.5.

181 FTI Report, ¶ 8.2 (emphasis added).

182 FTI Report, ¶ 8.3.

FTI purports to apply. Therefore we do not analyze FTI's method further, except to point out that even if it measured the relevant market reaction, FTI inflated total damages through a serious internal inconsistency.

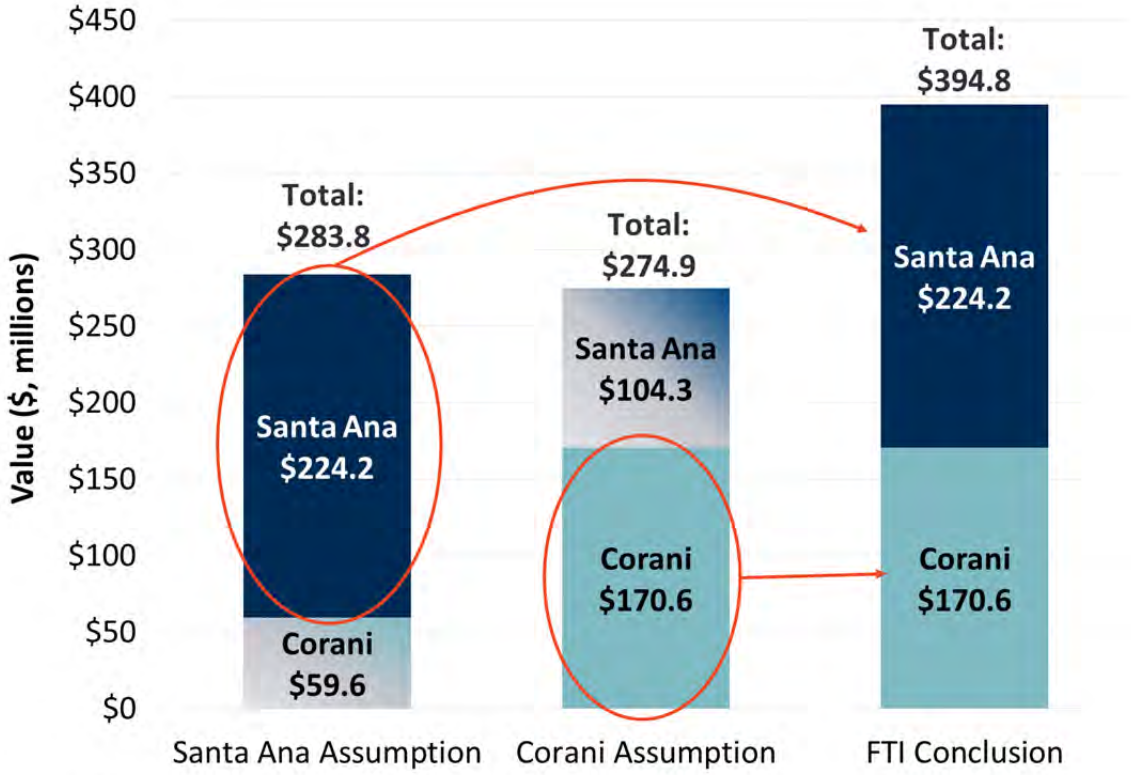
175. FTI starts from Bear Creek's EV as measured by its share price before the alleged breaches. To determine Corani's FMV, FTI then subtracts the value attributable to Santa Ana, based on the relative value estimated from analyst reports. The calculation has three steps:

- Step 1: Start with Bear Creek's EV at May 27, 2011 as a measure of the combined market value of Corani and Santa Ana.
- Step 2: Subtract the market value of Santa Ana assuming it is 19.2% of the combined market value.
- Step 3: Calculate the but-for market value of Corani on June 27, 2011 based on the change in an index of mining stocks.
- Step 4: Calculate damages by subtracting Bear Creek's actual EV on June 27 from the but-for value calculated in Step 3.

176. The inconsistency, which we illustrate in Figure 7, arises at Step 2. To calculate Corani's FMV, FTI says Santa Ana was worth $104.3 million.[183] To calculate Santa Ana damages, FTI says Santa Ana was worth $224.2 million, more than double the amount used to calculate Corani damages.

[183] This is reflected in the second column of Figure 27 in the FTI Report, which forms the basis for its conclusion on Corani damages.

Figure 7: FTI's Assumption about Santa Ana's Market Value Is Inconsistent across Its Santa Ana and Corani Damages Calculations



Source: FTI Report, Figure 27.

177. This inconsistency allows FTI to arrive at total damages of $394.8 million before interest, shown in the high bar labeled "FTI Conclusion" in Figure 7. An internally consistent approach would result in total damages of about $275 to $284 million regardless of FTI's view of Santa Ana's FMV:

- If FTI's DCF is accurate and Santa Ana's FMV is $224.2 million, then Corani damages should be $59.6 million by FTI's method, for a total of $283.8 million (bar labeled "Santa Ana Assumption" in Figure 7);
- If FTI's share price approach is accurate and Santa Ana's FMV is $104.3 million, then Corani damages should be $170.6 million by FTI's method, for a total of $274.9 million (bar labeled "Santa Ana Assumption" in Figure 7).[184]

[184] FTI considers a third case in FTI's Figure 27, which asserts that Bear Creek's share price on May 27, before the alleged breaches occurred, reflected no value for Santa Ana. Such an assumption beggars belief.

178. FTI explains its inconsistency by resorting to an assumption that Bear Creek's share price did not fully reflect Santa Ana's alleged FMV. The mispricing that FTI assumes is substantial: FTI concludes that only $104.3 million, or 46.5%, of Santa Ana's alleged FMV of $224 million was reflected in Bear Creek's share price. Yet, FTI assumes at the same time that the share price reflects Corani's market value correctly. One inconsistency is explained by another.

179. If it were true that the market was unable to reliably value Santa Ana, for which Bear Creek had recently released an updated Feasibility Study, then there is no justification to assume, as FTI does, that the same market can nevertheless correctly value the impact of the alleged unlawful acts on the more complex Corani project, for which less information was available (given its earlier stage).[185]

180. Of course, as we explained in Section II, there is no reason to believe that Bear Creek's share price does not reflect the FMV of the company's assets. It is even less believable that the market would price one asset correctly and misprice the other by over 50%.

IV. Claimant's Amount Invested in the Santa Ana Project

181. As an alternative measure of damages, we were asked to calculate the total amount of Bear Creek's investment in the Santa Ana project between the date it was acquired and the alleged expropriation date. We perform this calculation based on the annual exploration costs and the cumulative capitalized costs that Bear Creek reported for the Santa Ana Project in its consolidated financial statements from 2004, when Bear Creek acquired the Santa Ana project, to the second quarter of 2011, which ended on June 30, 2011 and is the reporting period that includes the alleged expropriation date.[186]

182. The decision regarding which of its costs to allocate to the Project was made by Bear Creek, which prepares its financial statements in accordance with Canadian generally accepted accounting principles (Canadian GAAP).[187] The exploration costs include drilling, salaries

---

[185] As of the Valuation Date, the most recent comprehensive analysis of the Corani project was the Prefeasibility Study released in October 2009.

[186] Given the alleged expropriation occurred on June 23, 2011, there is only a one-week period by which the reporting period exceeds the relevant period. It is unlikely that the resulting difference is material.

[187] The Canadian Institute of Chartered Accountants (CICA) started incorporating IFRS into Canadian GAAP in 2010 and required publicly accountable companies to apply such standards in 2011. Bear

Continued on next page

and consulting, engineering and consulting, assaying and sampling, community relations, supplies and general, travel, acquisition and claim fees, maintenance costs, and geophysics. The total exploration costs of all Bear Creek's projects are reported as part of the operating expenses on its Consolidated Statements of Loss and Comprehensive Loss for each reporting period. The capitalized costs include land acquisition costs and provisions for asset retirement obligations. Upon the expropriation of the Project, Bear Creek recognized an impairment loss of $0.9 million for the capitalized resource property costs.[188]

183. Table 7 presents the composition of exploration costs and capitalized costs reported for Santa Ana between 2004 and second quarter of 2011.

Continued from previous page

Creek started reporting in accordance with the updated standards in 2011 interim financials. Bear Creek 2011 Q2 Consolidated Financial Statements (BR-12), p. 6.

188 Bear Creek reported an impairment loss of $1 million in its 2011 Q2 interim report. However, that amount includes the provision for future reclamation costs, $0.1 million. Bear Creek later updated the impairment loss to be $0.9 million in its 2011 annual report, which includes only the impairment loss for the carrying amount of Santa Ana resource property costs. We exclude the provision for asset retirement obligations from the total amount invested. Bear Creek 2011 Q2 Consolidated Financial Statements (BR-12), p. 11; Bear Creek 2011 Consolidated Financial Statements for Year ended December 31, 2011 (BR-13), p. 18.

Table 7: Santa Ana Investment Costs (US$)

		Total 2004-2011Q2
[1]	Drilling	7,994,832
[2]	Salaries and consulting	7,404,312
[3]	Assaying and sampling	750,537
[4]	Travel	1,878,520
[5]	Supplies and general	2,302,516
[6]	Acquisition and claim fees (Maintenance costs)	508,149
[7]	Geophysics	57,407
[8]	Total Exploration Costs	20,896,273

Notes:
All expenses and costs are annual data, except for "Cumulative Asset Retirement Obligations," which is reported as a cumulative balance.
2011 Q2 numbers are rounded to the nearest thousand.
The line item "salaries and consulting" is split into "salaries and consulting" and "engineering and consulting" in the 2009 and 2010 annual reports and in the 2011Q2 report.
The line item "supplies and general" is split into "supplies and general" and "community relations" in the 2010 annual report.
[8]: Sum of [1] through [7]; expensed as operating expense every year.
[11]: Sum of [8] through [10].

184. Based on Bear Creek's reporting of exploration costs and capitalized resource property costs, we calculate the total cost of investment in the Santa Ana Project as of June 30, 2011 at $21,827,687.

V. Pre-Award Interest

185. The FTA states that compensation in the case of expropriation "shall be payable in a freely convertible currency and shall include interest at a commercially reasonable rate for that currency from the date of expropriation until date of payment"[189] We have been instructed to calculate the commercially reasonable rate that would apply to any damages determined as of the Valuation Date.

A. Pre-Award Interest at Respondent's Borrowing Rate

186. A commercial interest rate can be expressed as the sum of two components: the risk-free rate, which reflects compensation for the time value of money, and a risk premium, which reflects compensation for bearing risk. In this case, the appropriate risk-free rate is the short-term rate in U.S. Treasury bills because the currency in which damages are calculated is the U.S. dollar. A short-term interest rate is the appropriate measure of the time value of money, because it is the only rate that reflects no risk. Long-term rates, which typically are higher than short-term rates at any point in time, include a premium for liquidity and unanticipated inflation risk. We use the one-month U.S. Treasury bill rate, reset monthly.

187. The applicable spread above the risk-free rate depends on what risk the Claimant should be compensated for. Risk premiums embedded in commercial rates vary with the credit risk of the borrower: borrowers more likely to default face higher risk premiums. The FTA does not specify whose borrower risk should be reflected in the commercial rate applicable to pre-award interest. As the compensation amount is owed by Respondent, a natural benchmark is Respondent's default risk, which is reflected in the price of credit default swaps (CDS) on its sovereign bonds or in the yield on the same bonds.[190]

188. We use the CDS spread on Peru's sovereign bonds because in general the CDS market is more liquid than the market for sovereign bonds. It provides therefore a better measure of credit risk than the sovereign bond market. As with the risk-free rate, the appropriate

---

[189] FTA, Article 812.

[190] The Respondent's borrowing rate is the rate implied by the so-called "forced loan theory" of pre-award interest, under which the failure to provide immediate compensation upon expropriation is viewed as a forced loan that the Claimant made to Respondent. This appears to be the theory that Claimant puts forward in this case: "[w]ith respect to interest, by not paying compensation for the taking of the Santa Ana Project, Peru has in effect given itself an interest-free loan for several years …" (Claimant's Memorial, ¶ 13). We discuss this issue more in the section that addresses FTI's calculation of pre-award interest.

benchmark CDS contract is a short-term contract. For Peru, the shortest term CDS contract is for a one-year maturity.[191] The average one-year CDS risk premium during the period between the Valuation Date and September 24, 2015 is 0.49%.

189. To determine the pre-award interest rate, we added the sovereign spread to the one-year U.S. Treasury bill rate, reset monthly. The resulting average *annual* interest rate between the Claimant's Valuation Date and September 24, 2015 is 0.65%. The *cumulative* pre-award interest adds up to 2.79% of the award amount. To compare this to FTI's cumulative pre-award interest rate, we use FTI's assumption of 5% annual compounding interest from the Claimant's Valuation Date through September 24, 2015. This implies a cumulative pre-award interest amount of 23.65% of the award amount.

190. We were not asked to calculate interest until an expected future award date in this case and accordingly we have not formed an opinion about the expected award date. FTI has not presented the basis for its estimated award date of March 15, 2017 so we cannot comment on its estimation method. We note however that reliance on a short-term market interest rate precludes the exact calculation of future interest even if the award date were known, because interest rates would change in the meantime. To avoid unnecessary approximation, we only calculate pre-award interest to September 24, 2015 and anticipate updating our calculations prior to the hearing.

B. Pre-Award Interest at the Risk-Free Rate

191. The above discussion assumes that compensation for risk is deemed appropriate by the Tribunal. The question whether compensation for risk is appropriate, and therefore whether a spread above the risk-free rate should be included in the pre-award interest, hinges on legal questions of when the liability is created and whether certain risks are best characterized as financial risks or litigation risks.

192. The risk-free rate, which is also a commercial rate, has been proposed in the economic literature under the theory that awarding a higher rate would compensate the claimant for litigation risk. This view is in part an expression of a legal view regarding the presumption of innocence, under which liability arises only at the time of the award.

> The risk of the defendant's bankruptcy is not the only risk the plaintiff bears. It also bears the risk of losing the case …. [T]he risk that the defendant will

[191] CDS contracts on Peru sovereign credit are available for maturities between one and ten years (S&P Capital IQ).

> go bankrupt during trial is properly associated with the risks of litigation, not with the violation itself. It is hard to see why that risk should be singled out as one for which the plaintiff is to be compensated. Accordingly, we retain the position that prejudgment interest should be awarded at the risk-free rate.[192]

193. If the risk-free rate is applicable, then the resulting *cumulative* pre-award interest amount to September 24, 2015 is 0.69% of the award amount, that is, for every $1 million in damages as of the Claimant's Valuation Date, pre-award interest to the calculation date is about $6,900. This corresponds to an average *annual* interest risk-free rate of 0.16% over the calculation period.

C. FTI'S PRE-AWARD INTEREST RATE CALCULATION

194. FTI calculated pre-award interest using an annual interest rate of 5%, compounded monthly through March 15, 2017.[193] This calculation is based on three premises: that the right rate is 5%, that this rate should be compounded monthly, and that the relevant end-date of the calculation is March 15, 2017.

195. FTI states that it has been "instructed by Counsel that the applicable rate legal interest rate for judgments in Peru is determined based on a reference rate published by the Central Reserve Bank of Peru. On June 23, 2011, the legal interest rate was 5.0%."[194] Claimant's Memorial does not refer to a reference rate published by the Central Reserve Bank of Peru. The only statement in Claimant's Memorial that defines the appropriate pre-award interest rate is the following:

> With respect to interest, by not paying compensation for the taking of the Santa Ana Project, Peru has in effect given itself an interest-free loan for several years while simultaneously depriving Bear Creek of the funds to which it is rightly entitled. In order to avoid incentivizing States to engage in this type of conduct, Bear Creek submits that an appropriate rate of interest would be the cost to Peru had it been required to obtain a loan equivalent to the compensation amount in the international markets.[195]

---

192 Fisher, Franklin M. and R. Craig Romaine. "Janis Joplin's Yearbook and the Theory of Damages," *Journal of Accounting, Auditing & Finance* 5-1/2 (1990), pp. 147-148, (BR-124). The excerpt involves a discussion in the context of the U.S. legal system.

193 FTI Report, ¶ 2.8.

194 FTI Report, ¶ 9.3.

195 Claimant's Memorial, ¶ 13.

196. The Memorial therefore puts forward a forced-loan theory of pre-award interest and concludes that the applicable interest rate should reflect Respondent's cost of borrowing. That interest rate, as we calculated in Section V.A, varies over time and has been on average 0.65% per year from the Valuation Date through September 24, 2015.

197. If FTI's choice of interest rate is intended to reflect the statement excerpted above from Claimant's Memorial, then the rate it used is simply incorrect. First, it appears to be based on a rate published by the Central Reserve Bank of Peru for "Monetary regulation credit,"[196] which is a rate for credit in Peruvian currency, not in U.S. dollars.[197] For transactions in U.S. dollars, the rate for monetary regulation credit at FTI's Valuation Date was one-month LIBOR plus 1%, or 1.19%.[198] Because the award is calculated in U.S. dollars, the pre-award interest rate should also be defined in the same currency.

198. Second, because it is a short-term rate, as indicated by the reference to the one-month LIBOR benchmark for transactions in U.S. dollars, it cannot be used for the long term without updating, as FTI did by applying it to March 2017. While we agree that a short-term rate is appropriate, when using a short-term rate to calculate interest over periods beyond the term for which the interest rate is defined, the rate must be updated to reflect changes over time. In this case, because the benchmark LIBOR is a one-month rate, it should be updated every month. As of September 24, 2015, if FTI had applied the reference

---

[196] FTI's source document for the reference rate it used does not show any interest rate equal to 5.0%. It does however include two rates equal to 5.05%, one described as applicable to "Monetary regulation credit" and the other to "Outcome of the direct temporary buying securities (Repo)" (FTI-31). We do not know which of these two rates FTI used but note that, based on our review of similar documents to that relied on by FTI but covering different periods, the two rates are always equal (for example, see Summary of Monetary and Exchange Operations for September 21-25, 2015 (BR-137); Summary of Monetary and Exchange Operations for December 29-31, 2014 (BR-136); Summary of Monetary and Exchange Operations for December 21-28, 2012 (BR-135); all weekly such reports are published at http://www.bcrp.gob.pe/statistics/meoc/monetary-and-exchange-operations-weekly-tables.html).

[197] This is clear from a weekly report published also by Peru's Central Bank, in which the 5.05% rate for monetary regulation credit is listed under Monetary Indicators in Domestic Currency (Central Reserve Bank of Peru, Weekly Economic Report No. 26, July 1, 2011, p. xv (BR-138)). Another central Reserve Bank publication dated June 2011 states: "The Board also approved to maintain the annual interest rates on lending and deposit operations in domestic currency (not included in auctions) between the BCRP and the financial system, as described below … Direct repo and rediscount operations: 5.05 percent" (Central Reserve Bank of Peru Informative Note, "Monetary Program for June 2011, BCRP Maintains the Reference Interest Rate at 4.25%") (BR-140).

[198] Central Reserve Bank of Peru, Weekly Economic Report No. 26, July 1, 2011, p. xvii, fn. ****** (BR-138).

rate it relied on, but in the correct currency, the average annual interest would have been 1.20%, which implies cumulative interest of 5.29% of the award amount.[199]

199. With respect to compounding, we agree with FTI that commercial interest rates should be applied with compounding. The frequency of compounding should be consistent with how the interest rate is defined and how often it is reset. In this case, using a one-month benchmark rate is consistent with monthly compounding.

Workpaper 13: CapIQ Data: Mining Companies with 50%+ of Assets from Peru in FY 2011
Workpaper 14: FTI Silver Price Projections: Real vs. Nominal
Workpaper 15: Bloomberg Data: Silver Futures Prices
Workpaper 16: Pre-Award Interest as of September 24, 2015 Based on FTI Damages Quantum - Alternative Rates
Workpaper 17: Pre-Award Interest Factors
Workpaper 18: Interest Rate Data
Workpaper 19: Impact of Corrections to FTI's Santa Ana FMV Estimate (Base Case) ($ Million)
Workpaper 20 - A1: FTI Extended Life Case: Revised Schedule 1 Using SRK Inputs
Workpaper 20 - A2: Delay Costs Arising from Workpaper 20 - A1
Workpaper 20 - B1: FTI Extended Life Case: Revised Schedule 1 Using SRK Inputs and 14% Capex Overrun
Workpaper 20 - B2: Delay Costs Arising from Workpaper 20 - B1
Workpaper 20 - C1: FTI Extended Life Case: Revised Schedule 1 Using SRK Inputs, 1 Year Delay and 14% Increase in CapEx Expenditures
Workpaper 20 - C2: Delay Costs Arising from Workpaper 20 - C1
Workpaper 20 - D1: FTI Extended Life Case: Revised Schedule 1 Using SRK Inputs, 4 Year Delay and 14% Increase in CapEx Expenditures
Workpaper 20 - D2: Delay Costs Arising from Workpaper 20 - D1
Workpaper 20 - E1: FTI Extended Life Case: Revised Schedule 1 Using SRK Inputs, 4 Year Delay, 14% Increase in CapEx Expenditures, 12% Discount Rate
Workpaper 20 - E2: Delay Costs Arising from Workpaper 20 - E1
Workpaper 20 - F1: FTI Extended Life Case: Revised Schedule 1 Using SRK Inputs, 4 Year Delay, 14% Increase in CapEx Expenditures, 8% Discount Rate
Workpaper 20 - F2: Delay Costs Arising from Workpaper 20 - F1
Workpaper 21: RPA - Cash Flow Summary - Base Case - Adjusted Using SRK Inputs
Workpaper 22 - A1: FTI Extended Life Case: Revised Schedule 1 Using SRK Inputs
Workpaper 22 - A2: Delay Costs Arising from Workpaper 22 - A1
Workpaper 22 - B1: FTI Extended Life Case: Revised Schedule 1 Using SRK Inputs and 14% Capex Overrun
Workpaper 22 - B2: Delay Costs Arising from Workpaper 22 - B1
Workpaper 22 - C1: FTI Extended Life Case: Revised Schedule 1 Using SRK Inputs, 1 Year Delay and 14% Increase in CapEx Expenditures
Workpaper 22 - C2: Delay Costs Arising from Workpaper 22 - C1
Workpaper 22 - D1: FTI Extended Life Case: Revised Schedule 1 Using SRK Inputs, 4 Year Delay and 14% Increase in CapEx Expenditures
Workpaper 22 - D2: Delay Costs Arising from Workpaper 22 - D1
Workpaper 23: RPA - Cash Flow Summary - Extended Life Case - Adjusted Using SRK Inputs

Workpaper 4: Peru Mines: Delays Relative to Start Dates Projected at Feasibility Study Stage

Project		Owner	Metals	Original Projected Start of Production	Actual Start of Production/Projected Start of Production in 2011	Calculated Delay (years)
Corihuarmi	[1]	Minera IRL	Gold	2008	Q1 2008	0
Tantahuatay	[2]	Buenaventura	Gold, Silver	Jul-11	Jun-11	-0.08
La Zanja	[3]	Buenaventura	Gold	3Q or 4Q 2005	September 2010 - Community relations caused the delay; opposition to the project developed when environmental and health concerns arose in communities downstream from La Zanja. Opposition against the mine peaked in 2004 when protesters destroyed the exploration camp.	5
Mallay	[4]	Buenaventura	Silver, Lead, Zinc	2011	Feb-12	1
Conga	[5]	Buenaventura/Newmont Mining	Gold, Copper	Production: late 2014 or early 2015.	As of mid-2011, it was expected that production at Conga would begin in mid-2014. However, in late 2011, protests arose over water quality issues. Construction was halted in November 2011.	-0.75
Cerro Corona	[6]	Gold Fields	Gold, Copper	Appears to be early to mid 2007, due to references to an initial six month delay, followed by a delay to end of year 2007.	Sep-08	1.5
Lagunas Norte	[7]	Barrick/Silver Wheaton Corp	Gold, Silver	Q3 2005	Jun-05	-0.25
Pallancata	[8]	Hochschild	Silver, Gold	Q3 2007	Q3 2007	0
Pucamarca	[9]	Minsur	Gold, SIlver	Late 2007 to Early 2008	Production actually began on 1/12/2013, as it was stymied by community relations. In 2011, it was expected that production at Pucamarca would begin in late 2012.	4.5
Antamina	[10]	BHP Billiton/Glencore Canada	Copper, Zinc	Feb-02	Oct-01	-0.33
Cerro Lindo	[11]	Milpo	Lead, Zinc, Copper	Jul-07	2007	0
Tia Maria	[12]	Southern Copper/Newmont Mining	Copper	Q4 2010	The 2011 Southern Copper Annual Report states it was expected that production at Tia Maria would begin in early 2015, following the Peruvian government's rejection of the EIA in 2011 due to community resistance.	4.25
Rio Blanco	[13]	Monterrico Resources (owned by Zijin Mining)	Copper	2011	As of the 2011 Annual Report, the projected production date was 2015. This project was plagued by delays. In 2005, police allegedly shot dead one protester and tortured 30 others after they marched against the mine's construction.	4
Las Bambas	[14]	Xstrata (Glencore) Now Owned by MMG	Copper, Gold, Silver	2014	As of the 2011 Xstrata Annual Report, production at Las Bambas was expected in the second half of 2014.	0
Quellaveco	[15]	Anglo American	Copper	First production: 2014 Full production: 2016	As of the 2011 Anglo American Annual Report, the forecasts had been updated as follows: First Production: 2016 Full Production: 2017 The Annual Report states that "we've slowed down progress while we participate in a multi-stakeholder dialogue and work with the local communities to seek to fully understand their concerns and aspirations."	1.5
Pallca	[16]	Mitsui Mining and Smelting	Zinc	Jan-06	Mar-06	0.17
					Average Delay	1.28
					Average Delay for Project Subject to Community Opposition	3.15

Notes:
[A]: SPTSXVEN Index scaled to 1 on 05/27/2011.
[B]: SPTSX Index scaled to 1 on 05/27/2011.
[C]: SPBLPGPT Index scaled to 1 on 05/27/2011.
[D]: TXGM Index scaled to 1 on 05/27/2011.
[E]: BCM CN Equity scaled to 1 on 05/27/2011.
[G]: scaled to 1 on 05/27/2011.
[F]: Market Capitalization Weighted Return = Sum of (Market Cap_company i_t-1 x Return_company i_t) / Sum of (Market Cap_company i_t-1). Return from Workpaper 6, Market Cap from Workpa
[G]: Index of returns in [F] scaled to 1 on 05/27/2011.
[H]: Equal Weighted Return = Average Return for companies. If a company had no reported price for t or t-1, its return is not included in the average. Return from Workpaper 6.
[I]: Index of returns in [H] scaled to 1 on 05/27/2011.

Selected Management Discussion and Analysis, Form 20-F, Annual Reports, and company websites for the above mining companies. See BR-30 to BR-65.

Notes:

1) The above companies were pulled from S&P Capital IQ if their primary industry classifications were "Metals and Mining" or "Silver," and they had greater than 50% of either assets or revenue from Peru during FY 2011. (Search conducted on 9/2/15).
2) Note that based our review of news following the cancellation of the Santa Ana concession, Compania de Minas Buenaventura S.A.A. has been included in the group of mining companies with assets in Peru.
Nish, Caitlin. "DJ ADR Report: Shares End Higher As European Banks Gain." *Dow Jones Newswires* . 27 May 2011.
3) Companies trading on the New York Stock Exchange and Lima Stock Exchange are not excluded because they are in the same time zone as or one hour behind, respectively, companies on the Toronto Stock Exchange and TSX Venture Exchange.

Notes:

Adjustments highlighted in yellow. The structure of the DCF comes from FTI Schedule 1 Extended Life Case. When implementing the FTI Base Case using RPA Base Case inputs, the final NPV was within $2 million of FTI's calculation of $191 million. See FTI Report, ¶ 7.55.

(1) FTI Prices.
(2) Per the RPA Base Case, as adjusted with SRK revised inputs.
(3) Calculated as 1.0% on the first $60.0 million of NSR, 2.0% up to $120.0 million, and 3.0% beyond. See Revised Feasibility Study, page 144 (**FTI-06**).
(4) Calculated at 8% of accounting net income before taxes. See Revised Feasibility Study, page 144 (**FTI-06**).
Accounting depreciation calculated based on 15.0% annual straight-line depreciation (halved in the first year of addition). See Revised Feasibility Study, page 144 (**FTI-06**).
(5) Calculated based on a 30.0% corporate income tax rate. See Revised Feasibility Study, page 144 (**FTI-06**).
Depreciation for tax purposes calculated at a 20.0% depreciation rate on undepreciated capital cost. See PWC, "Doing Deals in Peru 2011", page 13 (**FTI-60**).
Tax losses from years prior to 2012 are assumed to be $14.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).
(6) IGV credits calculated at 19.0% of costs and recuperated at 19.0% of gross revenue. IGV credit prior to 2012 is assumed to be $8.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).
(7) Calculated based on a discount rate of 10.0%. See **FTI Appendix 5**.

Notes:
Adjustments highlighted in yellow.

(1) See **Figure 21**.
(2) Per the RPA Base Case, as adjusted with SRK revised inputs.
(3) Calculated as 1.0% on the first $60.0 million of NSR, 2.0% up to $120.0 million, and 3.0% beyond. See Revised Feasibility Study, page 144 (**FTI-06**).
(4) Calculated at 8% of accounting net income before taxes. See Revised Feasibility Study, page 144 (**FTI-06**).
Accounting depreciation calculated based on 15.0% annual straight-line depreciation (halved in the first year of addition). See Revised Feasibility Study, page 144 (**FTI-06**).
(5) Calculated based on a 30.0% corporate income tax rate. See Revised Feasibility Study, page 144 (**FTI-06**).
Depreciation for tax purposes calculated at a 20.0% depreciation rate on undepreciated capital cost. See PWC, "Doing Deals in Peru 2011", page 13 (**FTI-60**).
Tax losses from years prior to 2012 are assumed to be $14.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).
(6) IGV credits calculated at 19.0% of costs and recuperated at 19.0% of gross revenue. IGV credit prior to 2012 is assumed to be $8.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).
(7) Calculated based on a discount rate of 10.0%. See **FTI Appendix 5**.

Notes:

Adjustments highlighted in yellow. The structure of the DCF comes from FTI Schedule 1 Extended Life Case. When implementing the FTI Base Case using RPA Base Case inputs, the final NPV was within $2 million of FTI's calculation of $191 million. See FTI Report, ¶ 7.55.

(1) FTI Prices.
(2) Per the RPA Base Case, as adjusted with SRK revised inputs.
(3) Calculated as 1.0% on the first $60.0 million of NSR, 2.0% up to $120.0 million, and 3.0% beyond. See Revised Feasibility Study, page 144 (**FTI-06**).
(4) Calculated at 8% of accounting net income before taxes. See Revised Feasibility Study, page 144 (**FTI-06**).
Accounting depreciation calculated based on 15.0% annual straight-line depreciation (halved in the first year of addition). See Revised Feasibility Study, page 144 (**FTI-06**).
(5) Calculated based on a 30.0% corporate income tax rate. See Revised Feasibility Study, page 144 (**FTI-06**).
Depreciation for tax purposes calculated at a 20.0% depreciation rate on undepreciated capital cost. See PWC, "Doing Deals in Peru 2011", page 13 (**FTI-60**).
Tax losses from years prior to 2012 are assumed to be $14.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).
(6) IGV credits calculated at 19.0% of costs and recuperated at 19.0% of gross revenue. IGV credit prior to 2012 is assumed to be $8.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).
(7) Calculated based on a discount rate of 10.0%. See **FTI Appendix 5**.

Accounting depreciation calculated based on 15.0% annual straight-line depreciation (halved in the first year of addition). See Revised Feasibility Study, page 144 (**FTI-06**).

(5) Calculated based on a 30.0% corporate income tax rate. See Revised Feasibility Study, page 144 (**FTI-06**).
Depreciation for tax purposes calculated at a 20.0% depreciation rate on undepreciated capital cost. See PWC, "Doing Deals in Peru 2011", page 13 (**FTI-60**).
Tax losses from years prior to 2012 are assumed to be $14.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).

(6) IGV credits calculated at 19.0% of costs and recuperated at 19.0% of gross revenue. IGV credit prior to 2012 is assumed to be $8.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).

(7) Calculated based on a discount rate of 10.0%. See **FTI Appendix 5**.

Notes:

Adjustments highlighted in yellow. The structure of the DCF comes from FTI Schedule 1 Extended Life Case. When implementing the FTI Base Case using RPA Base Case inputs, the final NPV was within $2 million of FTI's calculation of $191 million. See FTI Report, ¶ 7.55.

(1) FTI Prices.
(2) Per the RPA Base Case, as adjusted with SRK revised inputs.
(3) Calculated as 1.0% on the first $60.0 million of NSR, 2.0% up to $120.0 million, and 3.0% beyond. See Revised Feasibility Study, page 144 (**FTI-06**).
(4) Calculated at 8% of accounting net income before taxes. See Revised Feasibility Study, page 144 (**FTI-06**).
Accounting depreciation calculated based on 15.0% annual straight-line depreciation (halved in the first year of addition). See Revised Feasibility Study, page 144 (**FTI-06**).
(5) Calculated based on a 30.0% corporate income tax rate. See Revised Feasibility Study, page 144 (**FTI-06**).
Depreciation for tax purposes calculated at a 20.0% depreciation rate on undepreciated capital cost. See PWC, "Doing Deals in Peru 2011", page 13 (**FTI-60**).
Tax losses from years prior to 2012 are assumed to be $14.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).
(6) IGV credits calculated at 19.0% of costs and recuperated at 19.0% of gross revenue. IGV credit prior to 2012 is assumed to be $8.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).
(7) Calculated based on a discount rate of 10.0%. See **FTI Appendix 5**.

Notes:

Adjustments highlighted in yellow. The structure of the DCF comes from FTI Schedule 1 Extended Life Case. When implementing the FTI Base Case using RPA Base Case inputs, the final NPV was within $2 million of FTI's calculation of $191 million. See FTI Report, ¶ 7.55.

(1) FTI Prices.
(2) Per the RPA Base Case, as adjusted with SRK revised inputs.
(3) Calculated as 1.0% on the first $60.0 million of NSR, 2.0% up to $120.0 million, and 3.0% beyond. See Revised Feasibility Study, page 144 (**FTI-06**).
(4) Calculated at 8% of accounting net income before taxes. See Revised Feasibility Study, page 144 (**FTI-06**).
Accounting depreciation calculated based on 15.0% annual straight-line depreciation (halved in the first year of addition). See Revised Feasibility Study, page 144 (**FTI-06**).
(5) Calculated based on a 30.0% corporate income tax rate. See Revised Feasibility Study, page 144 (**FTI-06**).
Depreciation for tax purposes calculated at a 20.0% depreciation rate on undepreciated capital cost. See PWC, "Doing Deals in Peru 2011", page 13 (**FTI-60**).
Tax losses from years prior to 2012 are assumed to be $14.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).
(6) IGV credits calculated at 19.0% of costs and recuperated at 19.0% of gross revenue. IGV credit prior to 2012 is assumed to be $8.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).
(7) Calculated based on a discount rate of 10.0%. See **FTI Appendix 5**.
(8) Workpaper 20 - F2: Delay Costs Arising from Workpaper 20 - F1.

Workpaper 20 - F1: FTI Extended Life Case: Revised Schedule 1 Using SRK Inputs, 4 Year Delay, 14% Increase in CapEx Expenditures, 8% Discount Rate

Sources & Notes:

[1]: SRK Extended Life inputs are highlighted in green.
[2]: Recovery percentages for silver have been adjusted so that the total current year plus previous year recovery is equal to the SRK suggested 70%.
[3]: Sustaining capital costs in the original RPA Base Case Model ended two years prior to the last year of production. To be consistent, sustaining capital costs are equal to RPA's original model and then end in year 4.
[4]: Reclamation and closure costs follow the methodology of the RPA model and Feasibility study. Salvage value is assumed to be captured following the last year of production.

Notes:

Adjustments are highlighted in green.

(1) FTI prices.

(2) Per the RPA Extended Life Case, as adjusted with SRK revised inputs.

(3) Calculated as 1.0% on the first $60.0 million of NSR, 2.0% up to $120.0 million, and 3.0% beyond. See Revised Feasibility Study, page 144 (**FTI-06**).

(4) Calculated at 8% of accounting net income before taxes. See Revised Feasibility Study, page 144 (**FTI-06**).
Accounting depreciation calculated based on 15.0% annual straight-line depreciation (halved in the first year of addition). See Revised Feasibility Study, page 144 (**FTI-06**).

(5) Calculated based on a 30.0% corporate income tax rate. See Revised Feasibility Study, page 144 (**FTI-06**).
Depreciation for tax purposes calculated at a 20.0% depreciation rate on undepreciated capital cost. See PWC, "Doing Deals in Peru 2011", page 13 (**FTI-60**).
Tax losses from years prior to 2012 are assumed to be $14.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).

(6) IGV credits calculated at 19.0% of costs and recuperated at 19.0% of gross revenue. IGV credit prior to 2012 is assumed to be $8.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).

(7) Calculated based on a discount rate of 10.0%. See **FTI Appendix 5**.

(5) Calculated based on a 30.0% corporate income tax rate. See Revised Feasibility Study, page 144 (**FTI-06**).
Depreciation for tax purposes calculated at a 20.0% depreciation rate on undepreciated capital cost. See PWC, "Doing Deals in Peru 2011", page 13 (**FTI-60**).
Tax losses from years prior to 2012 are assumed to be $14.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).

(6) IGV credits calculated at 19.0% of costs and recuperated at 19.0% of gross revenue. IGV credit prior to 2012 is assumed to be $8.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).

(7) Calculated based on a discount rate of 10.0%. See **FTI Appendix 5**.

Notes:

Adjustments are highlighted in green.

(1) FTI prices.

(2) Per the RPA Extended Life Case, as adjusted with SRK revised inputs.

(3) Calculated as 1.0% on the first $60.0 million of NSR, 2.0% up to $120.0 million, and 3.0% beyond. See Revised Feasibility Study, page 144 (**FTI-06**).

(4) Calculated at 8% of accounting net income before taxes. See Revised Feasibility Study, page 144 (**FTI-06**).
Accounting depreciation calculated based on 15.0% annual straight-line depreciation (halved in the first year of addition). See Revised Feasibility Study, page 144 (**FTI-06**).

(5) Calculated based on a 30.0% corporate income tax rate. See Revised Feasibility Study, page 144 (**FTI-06**).
Depreciation for tax purposes calculated at a 20.0% depreciation rate on undepreciated capital cost. See PWC, "Doing Deals in Peru 2011", page 13 (**FTI-60**).
Tax losses from years prior to 2012 are assumed to be $14.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).

(6) IGV credits calculated at 19.0% of costs and recuperated at 19.0% of gross revenue. IGV credit prior to 2012 is assumed to be $8.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).

(7) Calculated based on a discount rate of 10.0%. See **FTI Appendix 5**.

Notes:

Adjustments are highlighted in green.

(1) FTI prices.

(2) Per the RPA Extended Life Case, as adjusted with SRK revised inputs.

(3) Calculated as 1.0% on the first $60.0 million of NSR, 2.0% up to $120.0 million, and 3.0% beyond. See Revised Feasibility Study, page 144 (**FTI-06**).

(4) Calculated at 8% of accounting net income before taxes. See Revised Feasibility Study, page 144 (**FTI-06**).
Accounting depreciation calculated based on 15.0% annual straight-line depreciation (halved in the first year of addition). See Revised Feasibility Study, page 144 (**FTI-06**).

(5) Calculated based on a 30.0% corporate income tax rate. See Revised Feasibility Study, page 144 (**FTI-06**).
Depreciation for tax purposes calculated at a 20.0% depreciation rate on undepreciated capital cost. See PWC, "Doing Deals in Peru 2011", page 13 (**FTI-60**).
Tax losses from years prior to 2012 are assumed to be $14.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).

(6) IGV credits calculated at 19.0% of costs and recuperated at 19.0% of gross revenue. IGV credit prior to 2012 is assumed to be $8.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).

(7) Calculated based on a discount rate of 10.0%. See **FTI Appendix 5**.

Notes:

Adjustments are highlighted in green.

(1) FTI prices.

(2) Per the RPA Extended Life Case, as adjusted with SRK revised inputs.

(3) Calculated as 1.0% on the first $60.0 million of NSR, 2.0% up to $120.0 million, and 3.0% beyond. See Revised Feasibility Study, page 144 (**FTI-06**).

(4) Calculated at 8% of accounting net income before taxes. See Revised Feasibility Study, page 144 (**FTI-06**).
Accounting depreciation calculated based on 15.0% annual straight-line depreciation (halved in the first year of addition). See Revised Feasibility Study, page 144 (**FTI-06**).

(5) Calculated based on a 30.0% corporate income tax rate. See Revised Feasibility Study, page 144 (**FTI-06**).
Depreciation for tax purposes calculated at a 20.0% depreciation rate on undepreciated capital cost. See PWC, "Doing Deals in Peru 2011", page 13 (**FTI-60**).
Tax losses from years prior to 2012 are assumed to be $14.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).

(6) IGV credits calculated at 19.0% of costs and recuperated at 19.0% of gross revenue. IGV credit prior to 2012 is assumed to be $8.4 million. See Revised Feasibility Study, page 144 (**FTI-06**).

(7) Calculated based on a discount rate of 10.0%. See **FTI Appendix 5**.

Sources & Notes:
[1] Sink Extended Life inputs are highlighted in green.
[2] Recovery percentages for silver have been adjusted so that the total current year plus previous year recovery is equal to the SRK supplied 70%.
[3] The final three years of sustaining capital costs are assumed equal to the last year of data provided in the original RPA Extended Life model.
[4] Reclamation and closure costs follow the methodology of the RPA model. Salvage value is assumed to be captured following the last year of production.

Appendix C - Curriculum Vitae

GRAHAM A. DAVIS

1230 Judson Drive
Boulder, Colorado 80305, USA
Tel: (303) 273-3550
email: gdavis@mines.edu

Education

Degrees:

Ph.D., Mineral Economics, 1993
Pennsylvania State University, USA

MBA, 1988
University of Cape Town, South Africa

B.Sc. (with honors), **Metallurgical Engineering**, 1982
Queen's University at Kingston, Canada

Employment

Academic:

Professor, April 2006 - present
Division of Economics and Business, Colorado School of Mines

Undergraduate Courses Taught	Graduate Courses Taught
Microeconomics	Microeconomics
International Economics	Resource Economics
Economic Development	Economic Development
Freshman Success	Asset Valuation (Real Options)
Mathematical Economics	Mathematical Economics
Economics Field Session	Mineral and Energy Policy Analysis
Investments	Social License in Exploration and Mining
Public Policy (Honors)	Research Methodology
	Advanced Project Analysis

Associate Professor, April 1999 - April 2006
Division of Economics and Business, Colorado School of Mines

Assistant Professor, August 1993 - April 1999
Department of Mineral Economics, Colorado School of Mines

Instructor, 1992 - 1993
Department of Mineral Economics, The Pennsylvania State University

Assistant Lecturer, 1988 - 1989
The Graduate School of Business, University of Cape Town

Employment (continued)

Industry:

Resource Economics Consultant and Expert Witness, 1993 - Present
United States Dept. of Energy, United States Dept. of Justice, RMB Resources, Yates and Leal LLP, Hall and Evans LLP, Corporate Tax Management, Monument Resources, National Research Council, Pincock, Allen and Holt, Frommer Lawrence & Haug LLP, Platts Research & Consulting, Stevens Littman Biddison Tharp & Weinberg LLC, Berg Hill Greenleaf & Ruscitti LLP, Royal Gold, Community Systems Associates, Birch Mountain Resources, Westchester Resources, Africore (Ghana), Patterson Belknap Webb & Tyler LLP, De Beers, De Beers Canada, Duke Corporate Education, Shutts & Bowen LLP, Reoforce Inc., Australian Centre for Geomechanics, United Nations Conference on Trade and Development, Hines Norman Hines PL, Foulston Siefkin LLP, Rio Tinto Coal Australia, Yetter, Warden & Coleman, LLP, Boulder Scientific, GLG Research, Newmont Mining USA, CRC Mining, Ernst & Young LLP, Summit Consulting LLC, Debevoise and Plimpton LLP, Pomerantz, Grossman, Hufford, Dahlstrom & Gross LLP, The Brattle Group, Dechert (Paris) LLP, White & Case LLP.

World Bank Group Staff Member, 2013 - 2014

Consulting Metallurgist, 1986
Deblin Mines (silver/lead/zinc), Swakopmund, Namibia

Mill Metallurgist, 1985 - 1986
Equity Silver Mines Ltd. (Placer Dome), British Columbia, Canada

Metallurgical Engineer, 1982 - 1985
Rössing Uranium Ltd. (RTZ), Swakopmund, Namibia

Research Grants

Earth Resources Institute Mini-Grant, 2015, $12,500

Inter-American Development Bank, 2013: $20,666

Denham Capital Management LP, 2011 - 2012: $129,956

Ernst and Young LLP, 2011: $2,580

Ernst and Young LLP, 2010: $8,000

United Nations Industrial Development Organization, 2010: $29,038.

World Trade Organization, 2009: $9,396.

CRC Mining, 2009: $9,331.

CRC Mining, 2008: $30,000.

RCF Management LLC, 2008: $1,367.

Research Grants (continued)

International Council on Mining and Metals: $15,000.

AMEC Americas, 2004 - 2006: $2,000 annually.

U.S. Dept. of Energy, Fossil Energy Division, 2002 - 2003: $30,000.

International Council on Mining and Metals, 2002: $10,400.

National Renewable Energy Laboratory, 2001: $4,976.

Rio Tinto, 1997: $10,000.

Rio Tinto, 1996: $10,000.

National Science Foundation/Environmental Protection Agency Partnership for Environmental Research (NSF 95-48), R824705-01-0, 1995 - 1997: $101,000.

Professional Awards, Appointments, and Distinctions

William J. Coulter Chair in Mineral Economics, 2014 - 2016

Research Council, J.P. Morgan Center for Commodities, University of Colorado Business School, 2015 -

Associate Editor, Journal of Commodity Markets (Elsevier), 2015 -

Co-editor, Global Commodity Issues eJournal (Editor's Choice), 2015 -

Visiting Professor, GĚRENS Graduate School, Lima, Peru, 2013, 2014, 2015.

Mineral Economics Award, Society for Mining, Metallurgy and Exploration/American Institute of Mining, Metallurgical, and Petroleum Engineers, 2014.

Academic Advisor, The Brattle Group, 2013 -

Voted Outstanding Instructor in Mineral and Energy Economics, Division of Economics and Business, Colorado School of Mines, 1995 - 1996, 1996 - 1997, 1997 - 1998, 2005 - 2006, 2007 - 2008, 2011 - 2012, 2012 - 2013, 2014 - 2015.

Editorial Board, Resources Policy (Elsevier), 2007 -

Board of Trustees, Queen's University at Kingston (Canada), 2006 - 2012.

Board of Directors, Mineral Economics and Management Society, 2005 - 2007.

Visiting Scholar, Centre Interuniversitaire de Recherches en Economique Quantitative (CIREQ), McGill University, 2004.

Professional Awards, Appointment, and Distinctions (continued)

Member, National Research Council Standing Committee on Earth Resources, Board on Earth Sciences and Resources, 1999 - 2001.

Visiting Teaching Fellow, Department of Mineral Economics, Western Australia School of Mines, 1997.

Domingo Moreno Developmental Professorship in Mineral Economics, Colorado School of Mines, 1996 - 1997.

United Nations Conference on Trade and Development (UNCTAD) Secretary-General's Expert Group on Development Policies in Resource-based Economies, 1996.

Centennial Fellow, College of Earth and Mineral Sciences, Pennsylvania State University, 1996.

Visiting Scholar, Graduate School of Business, University of Cape Town, 1995.

Memberships

Member, American Economic Association (AEA)

Member, Association of Environmental and Resource Economists (AERE)

Registered Member, Society for Mining, Metallurgy, and Exploration (SME)

Fellow, Australasian Institute of Mining & Metallurgy (AusIMM)

Member, International Association for Energy Economics (IAEE)

Member, United States Association for Energy Economics (USAEE)

Member, Prospectors & Developers Association of Canada (PDAC)

Presentations and Chaired Sessions

"The Odd Notion of 'Reversible Investment'" (with R. Cairns), 19th Annual Real Options Conference, Athens and Monemvasia, Greece, June 17-20, 2015.

"The Comparison Sales Approach to Valuation: Science or Black Magic?" 2015 SME Annual Conference & Expo, Denver, Colorado, February 15-18, 2015.

"Mining, Oil, and Inequality," 2015 SME Annual Conference & Expo, Denver, Colorado, February 15-18, 2015.

"Mining, Oil, and Inequality," Canadian Resource and Environmental Economics Study Group Annual Conference 2014, Saskatoon, Canada, October 3-5, 2014.

Co-chair and session organizer (with Heather Douglas), "Mineral Economics: Approaches to Understanding and Managing Uncertainty and Risk," Prospectors and Developers Association of Canada (PDAC) 2014 Annual Meeting, Toronto, Canada, March 3, 2014.

"Explaining the Resource Curse," GĚRENS Graduate School, Lima, Peru, October 4, 2013.

"Replicating Sachs and Warner: Sources of Slow Growth in African Economies," 13th EADI General Conference, 2011 DSA Annual Conference, York, UK, September 19-22, 2011.

"The Economics of Optimal Stopping," 2010 AAEA, CAES, & WAEA Joint Annual Meeting, Denver, July 27, 2010.

"An Assessment of Mongolia's Comparative Advantage in Value-added Mineral and Energy Processing," Second Workshop on Industrial Policy in Mongolia, UNIDO and the Mongolian Government, Ulaanbaatar, June 3-4, 2010.

"Mine Planning and Sustainability" (with A. Newman), 2009 SME Annual Meeting and Exhibit, Denver, Colorado, February 22-25, 2009.

"Resource Booms and the Poor" (with A. Vasquez), 2009 SME Annual Meeting and Exhibit, Denver, Colorado, February 22-25, 2009.

Presentations and chaired sessions (continued)

"Resource Booms and the Poor" (with A. Vasquez), 28th US Association for Energy Economics/International Association for Energy Economics Annual North American Conference North American Conference, New Orleans, December 3-5, 2008.

"Resource Booms and the Poor" (with A. Vasquez), 2008 International Association for Energy Economics Asian Conference, Perth, Australia, November 7-9, 2008.

"Modern Strategic Mine Planning" (with A. Newman), 2008 Australian Mining Technology Conference, Twin Waters, Queensland, Australia, September 16-18, 2008.

"Can Resource Depletion Explain the Resource Curse?," Pontificia Universidad Católica de Chile, Santiago, Chile, May 17, 2007.

"Risk Analysis and Economic Valuation of Mining Projects" (with R. Halatchev and Y. Potvin), Australian Centre for Geomechanics, Brisbane, Australia, April 3-5, 2007.

"Recent Advances in Project Evaluation," Mineral Economics and Management Society 2007 Santiago Symposium, Santiago, Chile, March 26, 2007.

"Modeling Exploration Decision Making in a Value-creation Framework" (with M. Samis), Denver Region Exploration Geologists' Society, Denver, Colorado, November 6, 2006

"A Unified Theory of Optimal Stopping" (with R.D. Cairns), West Virginia University, Morgantown, West Virginia, October 6, 2006

"An Intuitive Approach to Optimal Stopping Under Certainty and Uncertainty" (with R.D. Cairns), 10th Annual International Conference on Real Options, New York, New York, June 14-17, 2006

"The Resource Curse: Assessing the Empirical Evidence," 2006 Allied Social Science Associations (ASSA) Meetings, Boston, Massachusetts, January 6-8, 2006.

"An Empirical Investigation of Resource Extraction and Sustainable Development," 25th US Association for Energy Economics/International Association for Energy Economics Annual North American Conference, Denver, Colorado, September 18-21, 2005.

"An Empirical Investigation of Mining and Sustainable Development," Inaugural Global Sustainable Development Conference, Minerals Council of Australia, Melbourne, Australia, October 25-29, 2004.

"Selling and Managing Offshore Oil Leases: A Real Options Analysis" (with R. Schantz), University of Auckland, Auckland, New Zealand, July 29, 2004.

"An Empirical Investigation of Mining and Sustainable Development," CRC Mining, Brisbane, Australia, July 18, 2004.

"An Empirical Investigation of Mining and Sustainable Development," CIM 2004 Annual Meeting & Exhibit, Edmonton, Alberta, May 12, 2004.

Presentations and chaired sessions (continued)

Session Chair, "Mining's View of Sustainability," Mineral Economics and Management Society (MEMS) 13th Annual Conference, Toronto, Ontario, April 21-23, 2004.

"An Empirical Investigation of Mining and Sustainable Development," Mineral Economics and Management Society (MEMS) 13th Annual Conference, Toronto, Ontario, April 23, 2004.

"Selling and Managing Offshore Oil Leases: A Real Options Analysis" (with R. Schantz), Centre Interuniversitaire de Recherches en Economique Quantitative (CIREQ), McGill University, Montreal, Quebec, March 19, 2004.

"An Empirical Investigation of Mining and Sustainable Development," 2004 SME Annual Meeting & Exhibit, Denver, Colorado, Feb. 23-25, 2004.

"Selling and Managing Offshore Oil Leases: A Real Options Analysis" (with R. Schantz), INFORMS 2003 Annual Meeting, Atlanta, Georgia, October 19-22, 2003.

"The Economic and Financial Theory Behind the Income Method of Mineral Property Appraisal," Center for Advanced Property Economics Mineral Appraisal Symposium, Denver, Colorado, October 1-3, 2003.

"Should Developing Countries Renounce Extractive Industries? A Perspective on the Debate," World Bank Oil, Gas, Mining, and Chemicals Department, Williamsburg, Virginia, June 18-20, 2003.

Session Chair, "Financial Decision Making for Sustainable Development," Mineral Economics and Management Society, 12th Annual Professional Program, Golden, Colorado, April 9-11, 2003.

"Economic Methods of Valuing Mineral Assets," American Society of Appraisers/Canadian Institute of Chartered Business Valuators 5th Joint Business Valuation Conference, Orlando, Florida, October 24-26, 2002.

"Strike When the Force is With You: A Robust Rule Involving the Force of Interest and Natural Resources" (with R.D. Cairns), University of Colorado Environmental and Resource Economics Workshop, Boulder, Colorado, July 15-16, 2002.

Session Co-Chair, "Student Paper Session," Mineral Economics and Management Society, 11th Annual Professional Program, Montreal, Quebec, April 10-12, 2002.

Session Co-Chair, "Student Paper Session," Mineral Economics and Management Society, 10th Annual Professional Program, Pittsburgh, Pennsylvania, April 5-7, 2001.

"The Pitfalls of Real Options: How to Avoid Poor Management Decisions," 50th Annual Meeting of the Midwest Finance Association, Cleveland, Ohio, March 29-31, 2001.

"Renewable Energy and Real Options Analysis," National Renewable Energy Laboratory, Washington D.C., March 8, 2001.

Presentations and chaired sessions (continued)

"Optimizing the Level of Renewable Energy Research and Development Using Real Options Analysis," National Renewable Energy Laboratory, Golden, Colorado, March 2, 2001.

"The Pitfalls of Real Options: How to Avoid Poor Management Decisions," Real Options 2000, hosted by the International Quality & Productivity Center, Chicago, Illinois, September 25-26, 2000.

Session Co-Chair, "Student Paper Session," Mineral Economics and Management Society, Ninth Annual Professional Program, Boulder, Colorado, April 12-14, 2000.

"Selling Oil Leases: A Long-term Real Options Analysis," (with R. Schantz), Allied Social Sciences Associations (ASSA) Annual Meeting, Boston, Massachusetts, January 7-9, 2000.

"The Potential for Economic Recovery of Metals from the Sillamäe Site," NATO Advanced Research Workshop, Tallinn, Estonia, October 5-9, 1998.

"Estimating Volatility and Dividend Yield When Valuing Real Options to Invest or Abandon," 2nd Annual Real Options Conference, Northwestern University, Chicago, Illinois, June 11-12, 1998.

Session Chair, "Financing Mining," Mineral Economics and Management Society, Seventh Annual Professional Program, Washington, D.C., March 25-27, 1998.

"On Estimating Volatility and the Rate of Return Shortfall When Valuing Real Options to Invest or Abandon," Midwest Finance Association, 47th Annual Meeting, Chicago, Illinois, March 19-21, 1998.

Session Chair, "Managing Capital in the Minerals Industry," 1998 SME Annual Meeting & Exhibit, Orlando, Florida, March 9-11, 1998

"Accounting for and Managing Political Risk in Mineral Projects," 1998 SME Annual Meeting & Exhibit, Orlando, Florida, March 9-11, 1998

"Valuing the Stock and Flow of Mineral and Renewable Assets in National Income Accounting," 1997 Workshop on Valuation and Environmental Policy, National Science Foundation, Arlington, Virginia, April 7-8, 1997.

"One Project: Two Discount Rates," 1997 SME Annual Meeting & Exhibit, Denver, Colorado, February 24, 1997.

"The Credibility of a Threat to Nationalize," Graduate School of Business, University of Colorado at Denver, November 13, 1996.

"The Cost of a Threat to Nationalize," 71st Annual Western Economic Association International Conference, San Francisco, California, June 28 - July 2, 1996.

"The Effect of NAFTA on the Economics of Mineral Production," 1996 SME Annual Meeting & Exhibit, Phoenix, Arizona, March 12, 1996.

Presentations and chaired sessions (continued)

Session Chair, “Mining and NAFTA - Two Years Later,” 1996 SME Annual Meeting & Exhibit, Phoenix, Arizona, March 12, 1996.

“Valuing Petroleum Reserves Using Current Net Price” (with R.D. Cairns), Front Range Finance Conference, University of Colorado, Boulder, Colorado, November 10, 1995.

“The Minerals Sector as Winner in Development Economics,” 18th Annual Third World Studies Conference, University of Nebraska at Omaha, Omaha, Nebraska, October 12-14, 1995.

“Valuing Petroleum Reserves Using Current Net Price” (with R.D. Cairns), University of Colorado Department of Economics, September 22, 1995.

“Brazil's Comparative Advantage in the Global Economy,” First International Symposium on Mining and Development, Universidade Estadual de Campinas, Campinas, Brazil, July 10-13, 1995.

Session Chair, “Using Financial Concepts in Mineral Management Decisions,” Mineral Economics and Management Society, Fourth Annual Professional Program, Boulder, Colorado, March 9-11, 1995.

Session Chair, “Commodity Price Projections to 2000,” 1995 SME Annual Meeting & Exhibit, Denver, Colorado, March 6-9, 1995.

“An Investigation of the Underpricing Inherent in DCF Valuation Techniques,” 1995 SME Annual Meeting & Exhibit, Denver, Colorado, March 6-9, 1995.

“Using Commodity Price Projections in Mineral Project Valuation,” 1995 SME Annual Meeting & Exhibit, Denver, Colorado, March 6-9, 1995.

“Demand and Supply in World Mineral Markets: Where Are We Headed?” Envirosciences Expo '93, Earth Resources Consortium, Denver, Colorado, October 7-8, 1993.

“The Empty Economics in South Africa's Industrial Policy,” 68th Annual Western Economic Association International Conference, Lake Tahoe, Nevada, June 20-24, 1993.

“The South African Export Incentive Scheme: Boom or Bust for the Minerals Sector?”, First Annual Mineral Economics and Management Society Professional Program, Sterling, Virginia, March 19-21, 1992.

“The Declining Influence of Economic Growth on Metal Demand,” International Symposium on Productivity and Technology in the Metallurgical Industries, co-sponsored by The Minerals, Metals & Materials Society and Gesellschaft Deutscher Metallhütten-und Bergleute, Cologne, West Germany, September 17-22, 1989.

Executive Short Courses

"Using Dynamic DCF and Real Options to Design, Value and Manage Natural Resource Projects," with Michael Samis. 8 hours or 24 hours of instruction, 2 Continuing Education units, offered through the Colorado School of Mines Office of Special Programs and Continuing Education.

"Using Monte Carlo Simulation to Design, Value and Manage Mineral and Energy Projects," with Michael Samis. 8 hours or 24 hours of instruction, 2 Continuing Education units, offered through the Colorado School of Mines Office of Special Programs and Continuing Education.

FLORIN A. DOROBANTU

Senior Associate

New York, NY | +1.212.789.3681 | Florin.Dorobantu@brattle.com

Dr. Florin Dorobantu specializes in business and project valuation and structured finance issues, applied in the context of international arbitration and litigation involving financial institutions and tax matters. He has prepared testimony on damages under the Arbitration Rules of the International Chamber of Commerce (ICC) and before the Permanent Court of Arbitration (PCA), and has provided support for expert testimony in arbitration proceedings before the International Centre for the Settlement of Investment Disputes (ICSID), London Court of International Arbitration (LCIA), and ICC, litigation in U.S. federal courts, state courts, and tax courts, and regulatory proceedings before U.S. public utilities commissions.

He has experience conducting complex discounted cash flow analyses, including building cash flow forecasts, estimating the impact of business and financial risks on cash flows and discount rates, and incorporating the value of real options in the valuation of long-lived assets. Dr. Dorobantu has performed valuation analyses in a variety of industries, including mining, oil & gas, large project engineering and construction, consumer goods, financial services, and business process outsourcing.

Dr. Dorobantu has worked closely with testifying experts on matters involving structured finance and asset backed securities. In litigations stemming from the recent global financial crisis, he analyzed the mark-to-market value of leveraged loans and mortgage backed securities in disputes between banks and investment funds, and analyzed the portfolio of a large hedge fund that collapsed following subprime mortgage-related losses. In tax-related litigations, he evaluated the economic substance of investment strategies involving foreign currency derivatives, cross-border leveraged leases, interest rate swaps and swaptions, and structured promissory notes.

EDUCATION

Ph.D. and M.A. in Economics, Duke University, 2007

B.A. in Economics and Business Administration, American University in Bulgaria, 2001

AREAS OF EXPERTISE

International Arbitration

Structured Finance and Securities Litigation

Tax Disputes

Regulatory Finance

EXPERIENCE

International Arbitration

- In a commercial arbitration under the arbitration rules of the ICC, Dr. Dorobantu testified on the quantum of damages stemming from the cancellation of an agreement to design and build a nuclear power plant.
- In an investment arbitration before the PCA over the alleged illegal expropriation of a silver mining project in South America, Dr. Dorobantu submitted expert testimony concerning the valuation methods that were appropriate to calculate the quantum of damages.
- In an investor-state dispute related to the denial of a mining license to a foreign investor, Dr. Dorobantu managed a Brattle team estimating the fair market value of a copper and gold mining project.
- In a commercial arbitration dispute before the LCIA, he analyzed economic issues related to the valuation of uranium mining assets.
- For an expropriation claim before the ICSID, Dr. Dorobantu worked on the valuation of an oil field investment in Latin America.
- In a commercial arbitration between a company and its supplier of raw materials, Dr. Dorobantu analyzed the economic aspects of a long-term procurement contract.
- In an investor-state dispute before the ICSID, Dr. Dorobantu was part of a Brattle team that assisted an academic expert in estimating damages from the cancellation of investment tax incentives for a firm in the food and beverage industry.

Structured Finance and Securities Litigation

- In a dispute between a broker-dealer and an investment fund related to the repo financing of a multi-billion dollar portfolio of mortgage-backed securities, Dr. Dorobantu managed a team that analyzed the broker-dealer's mark-to-market valuation of the MBS portfolio and estimated damages from the early termination of the repo financing.
- In a dispute between a hedge fund and an investment bank related to the marking to market of collateral underlying a total return swap, Dr. Dorobantu assisted the expert in analyzing the market value of a large portfolio of leveraged loans in the immediate aftermath of the Lehman Brothers bankruptcy filing.

- Dr. Dorobantu analyzed the portfolio of a major hedge fund that collapsed during the subprime mortgage crisis, as part of an engagement to assist a client in developing a complaint against the fund's managers.
- In litigation related to the fraud-driven bankruptcy of a broker-dealer, he was part of a team evaluating but-for and proximate causation issues, deepening insolvency and general damages on behalf of a large accounting firm.
- In a matter concerning the tax treatment of financial derivative positions held for hedging purposes, Dr. Dorobantu conducted analyses of economic aspects of interest rate swaps and swaptions.
- Dr. Dorobantu helped analyze the trading activity and positions of several traders in a matter involving potential market manipulation in commodity futures markets.

Tax Disputes

- In *Country Pine Finance, LLC v. Commissioner of Internal Revenue*, Dr. Dorobantu worked closely with testifying experts on evaluating the transaction's economic substance and whether the loan structure represented genuine indebtedness in a transaction structure known as Custom Adjustable Rate Debt Structure (CARDS).
- Dr. Dorobantu analyzed multiple cross-border leveraged lease transactions known as LILO and SILO that have been challenged by the United States Internal Revenue Service. His team evaluated the economic substance of each transaction, as well as the risks and benefits undertaken by the U.S. lessor upon entering into the transaction.
- In a case involving a listed transaction, he evaluated the profitability of a complex multi-step transaction involving a structured promissory note and a purchase of shares in a hedge fund.

Regulatory Finance

- For a water utility in California, Dr. Dorobantu evaluated the impact of a proposed revenue decoupling mechanism on the utility's cost of equity capital.
- For an electric distribution utility, he helped develop and implement a test of "significantly excessive earnings" consistent with newly adopted state legislation and based on rigorous statistical methods.
- Dr. Dorobantu has managed teams in developing cost of equity estimates for water utilities in a number of rate proceedings, and worked on project teams involved in cost of capital proceedings before the United States Federal Energy Regulatory Commission. During his involvement in these

and other engagements, Dr. Dorobantu has played an important role in refining and updating the cost of capital estimation methodology, and in revising and expanding expert testimony in the electric, natural gas, and water industries.
